### 7.5.3 Test Configuration

Test according to clause 6.2 radio frequency test setup 2.

### 7.5.4 Test Procedure

This test is required for any spurious emission that falls in a Restricted Band, as defined in Section 15.205. It must be performed with the highest gain of each type of antenna proposed for use with the EUT. Use the following spectrum analyzer settings:

For Above 1GHz:

The EUT was placed on a turn table which is 1.5m above ground plane.

Maximum procedure was performed on the highest emissions to ensure EUT compliance.

Span = wide enough to fully capture the emission being measured.

RBW = 1 MHz.

VBW ≥ RBW.

Sweep = auto.

Detector function = peak.  
Trace = max hold.

For Below 1GHz:

The EUT was placed on a turn table which is 0.8m above ground plane.  
Maximum procedure was performed on the highest emissions to ensure EUT compliance.  
Span = wide enough to fully capture the emission being measured.  
RBW = 100 kHz.  
VBW  $\geq$  RBW.  
Sweep = auto.  
Detector function = peak.  
Trace = max hold.

For Below 30MHz:

The EUT was placed on a turn table which is 0.8m above ground plane.  
Maximum procedure was performed on the highest emissions to ensure EUT compliance.  
Span = wide enough to fully capture the emission being measured.  
RBW = 9kHz.  
VBW  $\geq$  RBW.  
Sweep = auto.  
Detector function = peak.  
Trace = max hold.

For Below 150KHz:

The EUT was placed on a turn table which is 0.8m above ground plane.  
Maximum procedure was performed on the highest emissions to ensure EUT compliance.  
Span = wide enough to fully capture the emission being measured.  
RBW = 200Hz.  
VBW  $\geq$  RBW.  
Sweep = auto.  
Detector function = peak.  
Trace = max hold.

Follow the guidelines in ANSI C63.10 with respect to maximizing the emission by rotating the EUT, measuring the emission while the EUT is situated in three orthogonal planes (if appropriate), adjusting the measurement antenna height and polarization, etc. A pre-amp and a high pass filter are required for this test, in order to provide the measuring system with sufficient sensitivity. Allow the trace to stabilize. The peak reading of the emission, after being corrected by the antenna factor, cable loss, pre-amp gain, etc., is the peak field strength, which must comply with the limit. Submit this data. Now set the VBW to 10 Hz, while maintaining all of the other instrument settings. This peak level, once corrected, must comply with the limit. If the dwell time per channel of the hopping signal is less than 100 ms, then the reading obtained with the 10 Hz VBW may be further adjusted by a "duty cycle correction factor", derived from  $20\log(\text{dwell time}/100 \text{ ms})$ , in an effort to demonstrate compliance with the limit. Submit this data.  
Repeat above procedures until all frequency measured was complete.

## 7.6 CONDUCTED EMISSION TEST

### 7.6.1 Applicable Standard

According to IC RSS-Gen 8.8

### 7.6.2 Conformance Limit

FCC Part 15, Subpart B, Class B

| Conducted Emission Limit |            |         |
|--------------------------|------------|---------|
| Frequency(MHz)           | Quasi-peak | Average |
| 0.15-0.5                 | 66-56      | 56-46   |
| 0.5-5.0                  | 56         | 46      |
| 5.0-30.0                 | 60         | 50      |

Note:  
 1. The lower limit shall apply at the transition frequencies  
 2. The limit decreases in line with the logarithm of the frequency in the range of 0.15 to 0.50MHz.

### 7.6.3 Test Configuration

Test according to clause 6.3 conducted emission test setup 3.

### 7.6.4 Test Procedure

The EUT was placed on a table which is 0.8m above ground plane.  
 Maximum procedure was performed on the highest emissions to ensure EUT compliance.  
 Repeat above procedures until all frequency measured were complete.
