4. TEST RESULTS

4.1. TEST OBJECT DATA (Bluetooth Low Energy, BLE)

General EUT Description

The device is a display for electronic shelf labelling. The device is equipped with a passive NFC chip onboard which does not have its own rf generation. It works as a tag and can receive information from the NFC reader station. This device incorporates different communication protocols. The device uses Bluetooth Low Energy (BLE) protocol and Quuppa protocol which are generated by separate chips, but use a common antenna. Simultaneous transmission between BLE and Quuppa is not possible. The first part of this test report is for Bluetooth Low Energy (BLE) Protocol, the second part includes measurements for Quuppa protocol. Further, the device contains a licensed module (FCC ID: XMR2020BG95M2, IC: 10224A-2020BG95M2). Simultaneous transmission with BLE and Quuppa is possible and is considered in the respective subsections.

For operations in the 600 MHz band and the 698–746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log(P)$ dB.
