HEARING AID COMPATIBILITY

Applicant Name:
Samsung Electronics Co., Ltd.
129, Samsung-ro, Maetan dong,
Yeongtong-gu, Suwon-si
Gyeonggi-do 16677, Korea

Date of Testing:
12/22/2015 - 12/31/2015
Test Site/Location:
PCTEST Lab, Columbia, MD, USA
Test Report Serial No.:
0Y1512012045.A3L

FCC ID:	**A3LSMG930US**
APPLICANT:	**SAMSUNG ELECTRONICS CO., LTD.**

Scope of Test:	Audio Band Magnetic Testing (T-Coil)
Application Type:	Certification
FCC Rule Part(s):	CFR §20.19(b)
HAC Standard:	ANSI C63.19-2011 CTIA Test Plan for Hearing Aid Compatibility Rev 3.0, November 2013
EUT Type:	Portable Handset
Model(s):	SM-G930V, SM-G930A, SM-G930T, SM-G930R4, SM-G930P
Test Device Serial No.:	*Pre-Production Sample* [S/N: 07060 (Ant A), 07672 (Ant B)]

C63.19-2011 HAC Category: T3 (SIGNAL TO NOISE CATEGORY)

This wireless portable device has been shown to be hearing-aid compatible under the above rated category, specified in ANSI/IEEE Std. C63.19-2011 and has been tested in accordance with the specified measurement procedures. Test results reported herein relate only to the item(s) tested. Hearing-Aid Compatibility is based on the assumption that all production units will be designed electrically identical to the device tested in this report. North American Bands only.

I attest to the accuracy of data. All measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

1. INTRODUCTION

On July 10, 2003, the Federal Communications Commission (FCC) adopted new rules requiring wireless manufacturers and service providers to provide digital wireless phones that are compatible with hearing aids. The FCC has modified the exemption for wireless phones under the Hearing Aid Compatibility Act of 1998 (HAC Act) in WT Docket 01-309 RM-8658[1] to extend the benefits of wireless telecommunications to individuals with hearing disabilities. These benefits encompass business, social and emergency communications, which increase the value of the wireless network for everyone. An estimated more than 10% of the population in the United States show signs of hearing impairment and of that fraction, almost 80% use hearing aids. Approximately 500 million people worldwide and 30 million people in the United States suffer from hearing loss.

Compatibility Tests Involved:

The standard calls for wireless communications devices to be measured for:

- RF Electric-field emissions
- T-coil mode, magnetic-signal strength in the audio band
- T-coil mode, magnetic-signal frequency response through the audio band
- T-coil mode, magnetic-signal and noise articulation index

The hearing aid must be measured for:

- RF immunity in microphone mode
- RF immunity in T-coil mode

In the following tests and results, this report includes the evaluation for a wireless communications device.

2. TEST SITE LOCATION

I. Introduction

The map at the right shows the location of the PCTEST LABORATORY in Columbia, Maryland. It is in proximity to the FCC Laboratory, the Baltimore-Washington International (BWI) airport, the city of Baltimore and Washington, DC (See Figure 2-1).

These measurement tests were conducted at the PCTEST Engineering Laboratory, Inc. facility in Stonewood Business Center, Guilford Industrial Park, Columbia, Maryland. The site address is 7185 Oakland Mills Road, Columbia, MD 21046. The test site is one of the highest points in the Columbia area with an elevation of 390 feet above mean sea level. The site coordinates are 39° 10' 24" N latitude and 76° 49' 50" W longitude. The facility is 0.4 miles North of the FCC laboratory, and the ambient signal and ambient signal strength are approximately equal to those of the FCC laboratory.

4. ANSI C63.19-2011 PERFORMANCE CATEGORIES

I. MAGNETIC COUPLING

Axial and Radial Field Intensity

All orientations of the magnetic field, in the axial and radial position along the measurement plane shall be ≥ -18 dB(A/m) at 1 kHz in a 1/3 octave band filter per §8.3.1.

Frequency Response

The frequency response of the axial component of the magnetic field shall follow the response curve specified in EIA RS-504-1983, over the frequency range 300 Hz – 3000 Hz per §8.3.2.

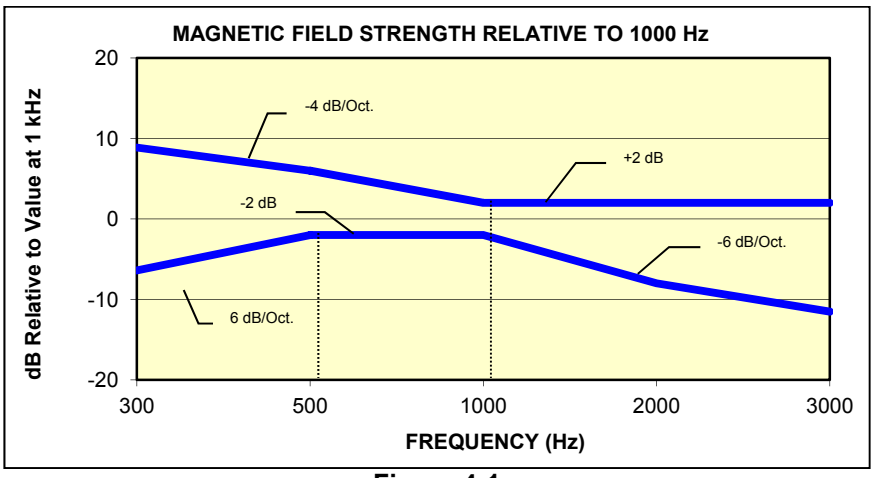

Figure 4-1
Magnetic field frequency response for Wireless Devices with an axial field ≤-15 dB(A/m) at 1 kHz

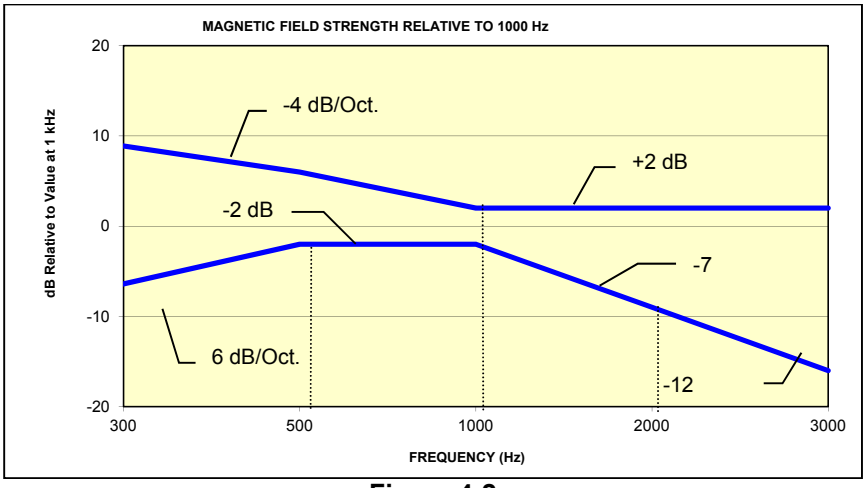

Figure 4-2
Magnetic Field frequency response for wireless devices with an axial field that exceeds -15 dB(A/m) at 1 kHz

If you have any questions about this international copyright or have an enquiry about obtaining additional rights to this report or assembly of contents thereof, please contact INFO@PCTESTLAB.COM.

Signal Quality

The table below provides the signal quality requirement for the intended audio magnetic signal from a wireless device. Only the RF immunity of the hearing aid is measured in T-coil mode. It is assumed that a hearing aid can have no immunity to an interference signal in the audio band, which is the intended reception band for this mode. The only criterion that can be measured is the RF immunity in T-coil mode. This is measured using the same procedure as the audio coupling mode at the same levels.

The signal quality of the axial and radial components of the magnetic field was used to determine the T-coil mode category.

Category	Telephone RF Parameters
	Wireless Device Signal Quality [(Signal + Noise)-to-noise ratio in dB]
T1	0 to 10 dB
T2	10 to 20 dB
T3	20 to 30 dB
T4	> 30 dB

Table 4-1
Magnetic Coupling Parameters

II. Scanning Mechanism

Manufacturer:	TEM
Accuracy:	± 0.83 cm/meter
Minimum Step Size:	0.1 mm
Maximum speed	6.1 cm/sec
Line Voltage:	115 VAC
Line Frequency:	60 Hz
Material Composite:	Delrin (Acetal)
Data Control:	Parallel Port
Dynamic Range (X-Y-Z):	45 x 31.75 x 47 cm
Dimensions:	36” x 25” x 38”
Operating Area:	36” x 49” x 55”
Reflections:	< -20 dB (in anechoic chamber)

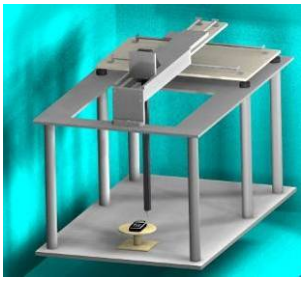

Figure 5-3
RF Near-Field Scanner

III. 3GPP2 Normal Test Signal (Speech)

Manufacturer:	3GPP2 (TIA 1042 §3.3.1)
Stimulus Type:	Modified-IRS weighted, multi-talker speech signal, 4 Male and 4 Female speakers (alternating)
Single Sample Duration:	51.62 seconds
Activity Level:	77.4%

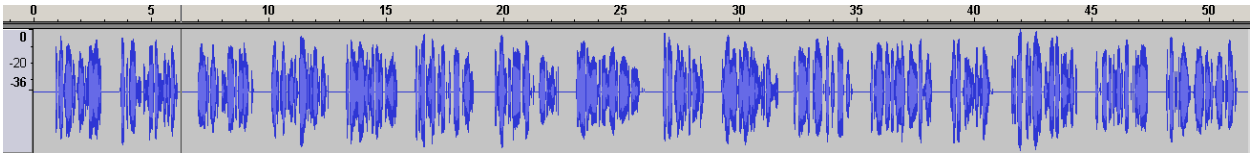

Figure 5-4
Temporal Characteristic of Normal Test Signal

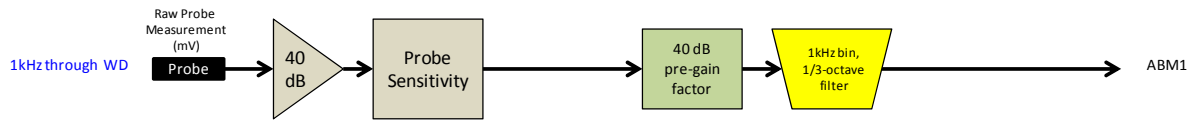
ABM1 Measurement Block Diagram:



ABM2 Measurement Block Diagram:

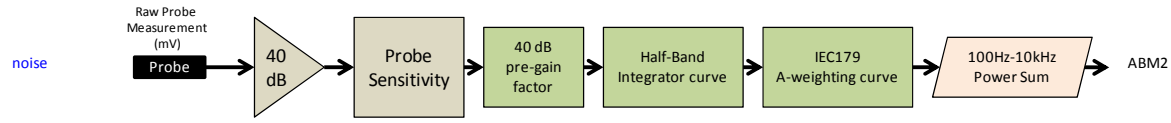


Figure 5-5 Magnetic Measurement Processing Steps

IV. Test Procedure

A. Ambient Noise Check per C63.19 §7.3.1
   a. Ambient interference was monitored using a Real-Time Analyzer between 100-10,000 Hz with 1/3 octave filtering.
   b. "A-weighting" and Half-Band Integration was applied to the measurements.
   c. Since this measurement was measured in the same method as ABM2 measurements, this level was verified to be more than 10 dB below the lowest measurement signal (which is the highest ABM2 measurement for a T4 WD). Therefore the maximum noise level for a T4 WD with an ABM1 = -18 dBA/m is:

-18 - 30 - 10= -58 dBA/m

B. Measurement System Validation(See Figure 5-1)
   a. The measurement system including the probe, pre-amplifier and acquisition system were validated as an entire system to ensure the reliability of test measurements.
   b. ABM1 Validation
   The magnetic field at the center of the Helmholtz coil is given by the equation (per C63.19 Annex D.10.1):

$$H_c = \frac{NI}{r\sqrt{1.25^3}} = \frac{N(\frac{V}{R})}{r\sqrt{1.25^3}}$$

Where H_c = magnetic field strength in amperes per meter
N = number of turns per coil

For the Helmholtz Coil, N=20; r=0.08m; R=10.2Ω and using V=18mV:

$$H_c = \frac{20 \cdot (\frac{0.018}{10.2})}{0.08 \cdot \sqrt{1.25^3}} = 0.316 A/m \approx -10 dB(A/m)$$

Therefore a pure tone of 1kHz was applied into the coils such that 18mV was observed across the resistor. The voltmeter used for measurement was verified to be capable of measurements in the audio band range. This theoretically generates an expected field of -10 dB(A/m) in the center of the Helmholtz coil which was used to validate the probe measurement at -10dB(A/m). This was verified to be within ± 0.5 dB of the -10dB(A/m) value (see Page 57).

If you have any questions about this international copyright or have an enquiry about obtaining additional rights to this report or assembly of contents thereof, please contact INFO@PCTESTLAB.COM.

c. Frequency Response Validation

The frequency response through the Helmholtz Coil was verified to be within 0.5 dB relative to 1kHz, between 300 – 3000 Hz using the Normal signal as shown below:

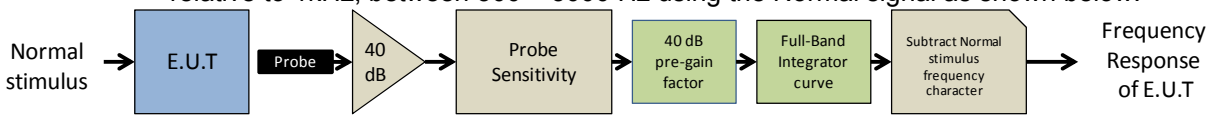

Figure 5-6 Frequency Response Validation

d. ABM2 Measurement Validation

WD noise measurements are filtered with A-weighting and Half-Band Integration over a frequency range of 100Hz – 10kHz to process ABM2 measurements. Below is the verification of the system processing A-weighting and Half-Band integration between system input to output within 0.5 dB of the theoretical result:

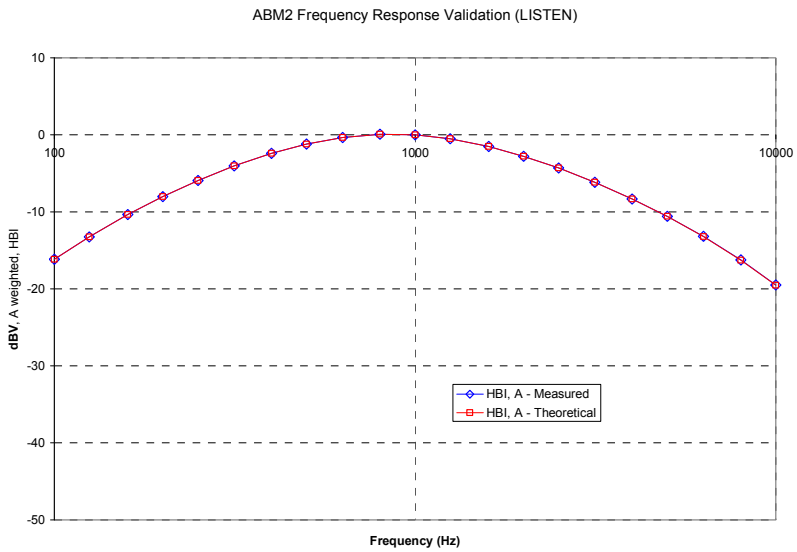

Figure 5-7
ABM2 Frequency Response Validation

The ABM2 result is a power sum from 100Hz to 10kHz with half-band integration and A-weighting. To verify the power sum measurement, a power sum over the full band was measured and verified to track with the source level (See Figure 5-8). Therefore the setup in this step was used to verify the power sum post-processing for ABM2 measurements. See below block diagram:

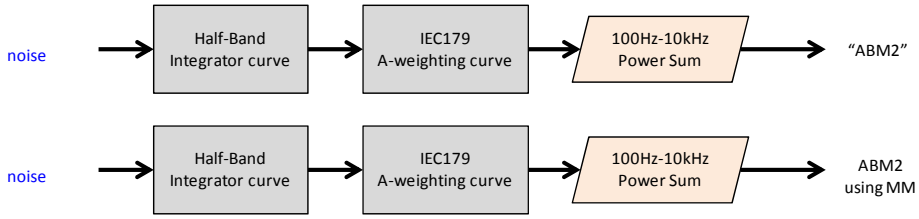

Figure 5-8
ABM2 Validation Block Diagram

The power summed output results for a known input were compared to the multi-meter results to verify any deviation in the post-processing implemented with the power-sum.

ABM2 Power Sum Validation

C. Measurement Test Setup
   a. Fine scan above the WD (TEM)
      i. A multitone signal was applied to the handset such that the phone acoustic output was stable within 1dB over the probe settling time and with the acoustic output level at the C63.19 specified levels (below). The measurement step size was in 2 mm increments at a distance of 10 mm between the surface of the wireless device as shown below:

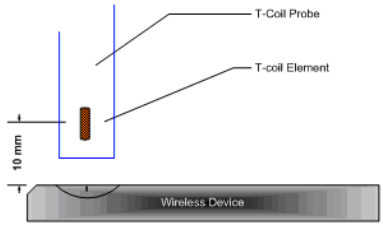

Figure 5-10
Measurement Distance

.

      ii. After scanning, the planar field maximum point was determined. The position of the probe was moved to this location to setup the test using the SoundCheck system.
      iii. These steps were repeated for all T-coil orientations (axial and radial) per Figure 5-14 after a T-coil orientation was fully measured with the SoundCheck system.

b. Speech Signal Setup to Base Station Simulator

i. C63.19 Table 7-1 states audio reference input levels for various technologies:

Standard	Technology	Input Level (dBm0)
TIA/EIA/IS-2000	CDMA	-18
J-STD-007	GSM (217)	-16
T1/T1P1/3GPP	UMTS (WCDMA)	-16
iDEN™	TDMA (22 and 11 Hz)	-18

The CMU200 audio levels were determined using base station simulator manufacturer calibration procedures resulting in the below corresponding voltages relative to handset test point level (in dBm0):

Table 5-3
CMU200 Voltage Input Levels for Audio

dBm0 Ref.	Voltage		Notes
3.14 dBm0	990.5 mV	-0.08 dBV	From GSM "DECODER CAL". (What is needed through Encoder for FS)
-16 dBm0	109.4 mV	-19.2 dBV	For Speechcod/Handset Low
dBm0 Ref.	**Voltage**		**Notes**
3.14 dBm0	1068.5 mV	0.58 dBV	From UMTS "DECODER CAL". (What is needed through Encoder for FS)
-16 dBm0	118.0 mV	-18.6 dBV	For Handset Low
dBm0 Ref.	**Input Voltage**		**Notes**
3.14 dBm0	1052.0 mV	0.4 dBV	From CDMA2K "DECODER CAL". (What is needed through Encoder for FS)
-18 dBm0	92.260 mV	-20.7 dBV	For 8k Enhanced (Low)

ii. See Section 6 for more information regarding CMW500 audio level settings for Voice Over LTE (VoLTE) testing.

c. Real-Time Analyzer (RTA)

i. The Real-Time Analyzer was configured to analyze measurements using 1/3 Octave band weighted filtering.

d. WD Radio Configuration Selection

i. The device was chosen to be tested in the worst-case ABM2 condition (see below for GSM, see Section 7 for more information regarding worst-case configurations for CDMA and UMTS. LTE configuration information can be found in Section 6):

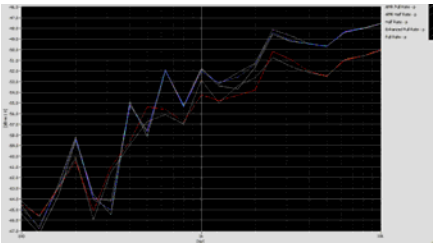

Figure 5-11
Vocoder Analysis for ABM Noise for GSM

D. Signal Quality Data Analysis

a. Narrow-band Magnetic Intensity

i. The standard specifies a 1kHz 1/3 octave band minimum field intensity for a sine tone. The ABM1 measurements were evaluated at 1kHz with 1/3 octave band filtering over an averaged period of 10 seconds.

b. Frequency Response

i. The appropriate frequency response curve was measured to curves in Figure 4-1 or Figure 4-2 between 300 – 3000 Hz using digital linear averaging (limit lines chosen according to measurement found in step 4a). A linear average over 3x the length of the artificial voice signal (3x sampling) was performed. A 10 second delay was configured in the measurement process of the stimulus to ensure handset vocoder latency effects and echo cancellation devices (if any) were appropriately stabilized during measurements.

ii. The appropriate post-processing was applied according to the system processing chain illustrated in Figure 5-6. All R10 frequencies were plotted with respect to 0dB at 1kHz value and aligned with respect to the EIA-504 mask.

iii. The margin is represented by the closest measured data point on the curve to the EIA-504 limit lines, in dB.

c. Signal Quality Index

i. Ensuring the WD was at maximum RF power, maximum volume, backlight on, display on, maximum contrast setting, keypad lights on (when possible) with no audio signal through the vocoder, the WD was measured over at least 100 Hz – 10,000 Hz, maximized over 5 seconds with a 50ms sample time for the ABM2 measurement (5 second time period is used in noise measurements under standards such as IEEE 269, etc.).

ii. After applying half-band integration and A-weighting to the result, a power sum was applied over each 1/3 octave bandwidth frequency for an ABM2 value.

iii. This result was subtracted from the ABM1 result in step a, to obtain the Signal Quality.

V. Test Setup

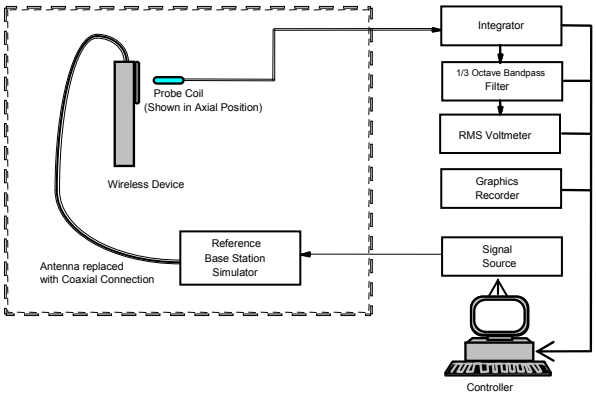

Figure 5-12
Audio Magnetic Field Test Setup

VI. Deviation from C63.19 Test Procedure

Non-conducted RF connection due to inaccessible RF ports.

If you have any questions about this international copyright or have an enquiry about obtaining additional rights to this report or assembly of contents thereof, please contact INFO@PCTESTLAB.COM.

VII. Air Interface Technologies Tested

All air interfaces which support voice capabilities over a managed CMRS were tested for T-coil. See Table 3-1 for more details regarding which modes were tested.

According to the April 2013 TCB workshop slides, OTT data services are outside the current definition of a managed CMRS service and are currently not required to be evaluated.

VoIP over WIFI CMRS air interfaces were not tested in accordance with the guidance issued by OET in KDB publication 285076 D02 T-Coil testing for CMRS IP.

VIII. Wireless Device Channels and Frequencies

1. 2G/3G Modes

The frequencies listed in the table below are those that lie in the center of the bands used for cellular telephony. Low, middle and high channels were tested in each band for FCC compliance evaluation to ensure the maximum emission is captured across the entire band.

Table 5-4
Center Channels and Frequencies

Test frequencies & associated channels	
Channel	**Frequency (MHz)**
Secondary Cellular 820	
564 (CDMA)	820.10
Cellular 850	
384 (CDMA)	836.52
190 (GSM)	836.60
4183 (UMTS)	836.60
PCS 1900	
600 (CDMA)	1880
661 (GSM)	1880
9400 (UMTS)	1880
AWS 1750	
1412 (UMTS)	1730.40

2. 4G (LTE) Modes

The middle channel for every band and bandwidth combination was tested for each probe orientation. The band and bandwidth combination from each probe orientation resulting in the worst-case SNNR was additionally tested using low and high channels for that band and bandwidth combination. See Tables 8-22 through 8-39 for LTE bandwidths and channels.

IX. RF Emission Effect on T-coil Measurements

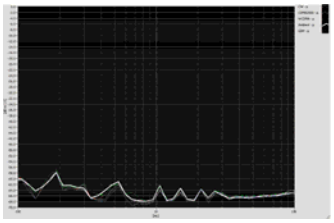

Figure 5-13
High power RF Emissions Effect with HAC Dipole on the T-coil Probe System 10mm between dipole maximum and magnetic probe

6. VOLTE TEST SYSTEM SETUP AND DUT CONFIGURATION

I. Test System Setup for VoLTE T-coil Testing

1. Equipment Setup

The general test setup used for VoLTE is shown below (adopted from FCC KDB 285076 D02). The callbox used when performing VoLTE T-coil measurements is a CMW500. The Data Application Unit (DAU) of the CMW500 was used to simulate the IP Multimedia Subsystem (IMS) server.

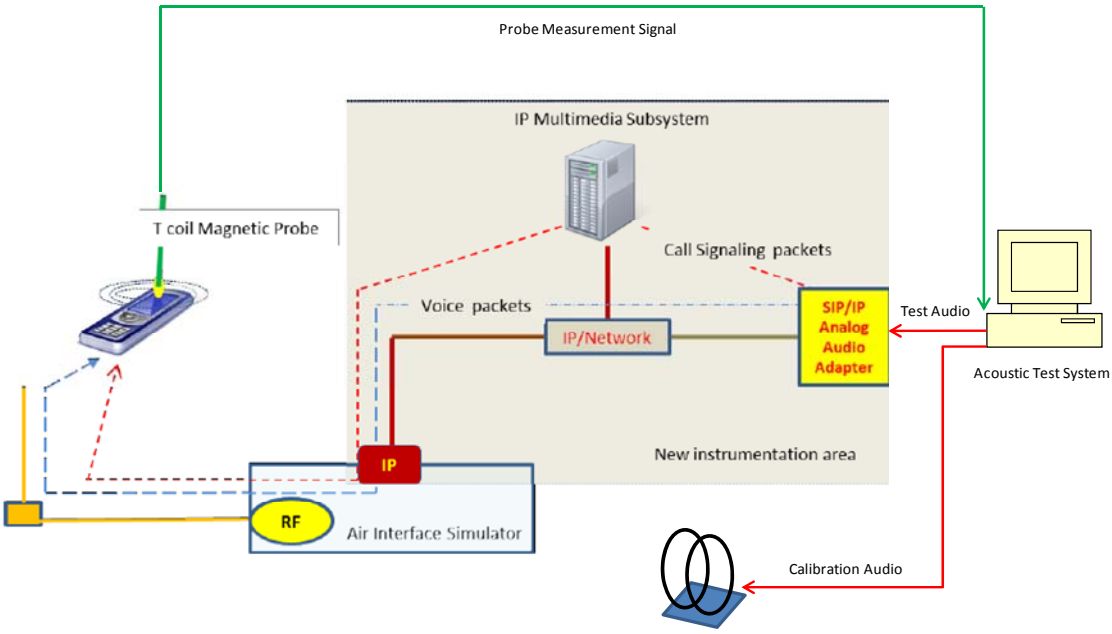

Figure 6-1
Test Setup for VoLTE T-Coil Measurements

2. Audio Level Settings

According to the July 2012 interpretations by the C63 Committee regarding the appropriate audio levels to be used for LTE T-coil testing, -16dBm0 shall be used for the normal speech input level*. The CMW500 base station simulator was manually configured to ensure that the settings for speech input and full scale levels resulted in the -16dBm0 speech input level to the DUT for the VoLTE connection.

II. DUT Configuration for VoLTE T-coil Testing

1. Radio Configuration

An investigation was performed on the worst-case LTE Band and bandwidth combination to determine the modulation and RB configuration to be used for testing. 16QAM, 1RB, 0RB offset was used for the testing as the worst-case configuration for the handset. See below table for SNNR comparison between different radio configurations:

Frequency [MHz]	Channel	Bandwidth [MHz]	Modulation	RB Size	RB Offset	ABM1 [dB(A/m)]	ABM2 [dB(A/m)]	SNNR [dB]
836.5	20525	1.4	QPSK	1	0	5.08	-45.28	50.36
836.5	20525	1.4	QPSK	1	2	5.05	-45.07	50.12
836.5	20525	1.4	QPSK	1	5	5.22	-46.32	51.54
836.5	20525	1.4	QPSK	3	0	5.10	-44.56	49.66
836.5	20525	1.4	QPSK	3	2	5.17	-45.75	50.92
836.5	20525	1.4	QPSK	3	3	5.16	-45.14	50.30
836.5	20525	1.4	QPSK	6	0	4.98	-45.60	50.58
836.5	20525	1.4	16QAM	1	0	5.20	-36.65	41.85
836.5	20525	1.4	16QAM	1	2	5.25	-38.01	43.26
836.5	20525	1.4	16QAM	1	5	5.10	-37.30	42.40
836.5	20525	1.4	16QAM	3	0	5.12	-37.23	42.35
836.5	20525	1.4	16QAM	3	2	5.15	-38.31	43.46
836.5	20525	1.4	16QAM	3	3	5.14	-36.95	42.09
836.5	20525	1.4	16QAM	6	0	5.17	-37.84	43.01

Figure 6-2
LTE SNNR by Radio Configuration

2. Codec Configuration

An investigation was performed on the worst-case LTE Band and bandwidth combination to determine the audio codec configuration to be used for testing. The NB AMR 4.75kbps setting was used for the audio codec on the CMW500 for VoLTE T-coil testing. See below table for ABM1 and ABM2 comparisons between different codecs and codec data rates:

Codec Setting:	WB AMR 23.85kbps	WB AMR 6.60kbps	NB AMR 12.2kbps	NB AMR 4.75kbps	Orientation	Channel	Antenna Config.
ABM1 Pre-test (dBA/m)	6.90	6.76	6.04	5.22	Axial	20525 (B5, 1.4MHz)	Ant A
ABM2 Pre-test (dBA/m) (A-weight, Half-Band Int.)	-37.35	-37.77	-36.35	-36.04			
S+N/N (dB)	44.25	44.53	42.39	**41.26**

7. FCC 3G MEASUREMENTS

I. CDMA Test Configurations

Radio Configuration 1, Service Option 68 was used for the testing according to the CTIA Test Plan and also as one of the worst-case configuration for the handset due to vocoder gating from the EVRC logic. See below plot for an example of ABM noise comparison between operational field service options and radio configurations for a CDMA2000 handset:

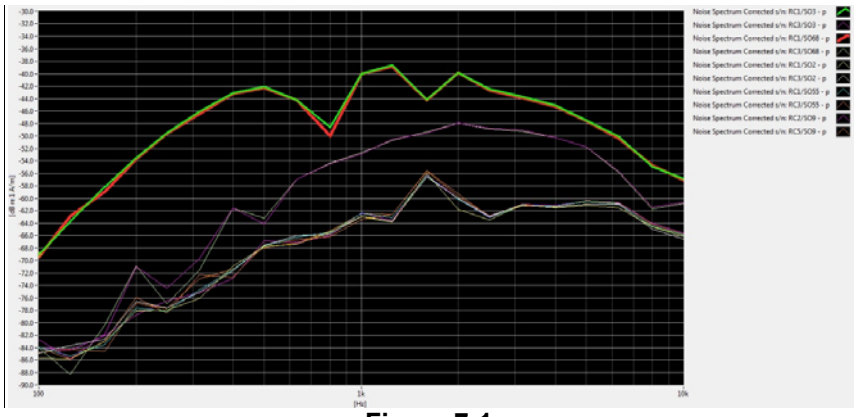

Figure 7-1
CDMA Audio Band Magnetic Noise

II. UMTS Test Configurations

AMR at 12.2kbps, 13.6kbps SRB was used for the testing as the worst-case configuration for the handset. See below plot for ABM noise comparison between vocoder rates:

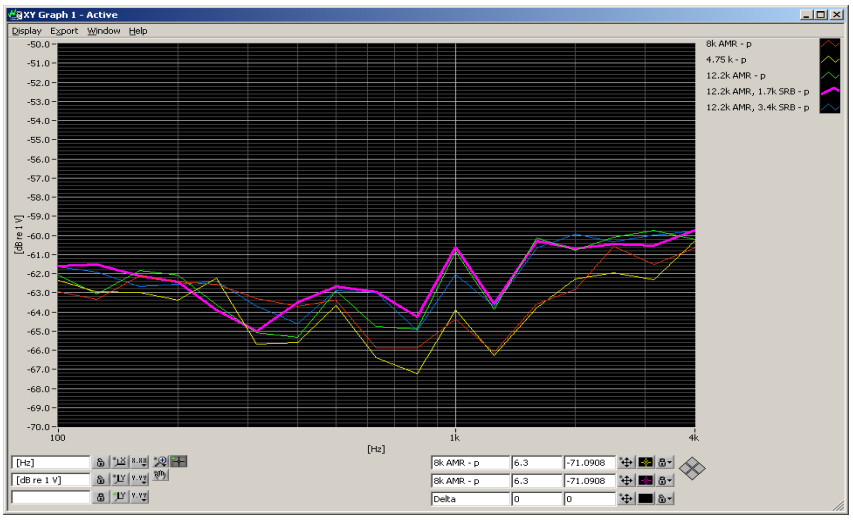

Figure 7-2
UMTS Audio Band Magnetic Noise

Table 8-6
Table of Results for LTE B5 – Ant A

C63.19 Sec.	Mode	BW/Band	Test Description	Minimum Limit*	Measured	Verdict
				dBA/m	*dBA/m*	*PASS/FAIL*
8.3.1	LTE	1.4MHz/ Band 5	Intensity, Axial	-18	5.3	PASS
8.3.1			Intensity, Radial	-18	-2.9	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	40.6	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	43.9	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	3MHz/ Band 5	Intensity, Axial	-18	5.3	PASS
8.3.1			Intensity, Radial	-18	-2.7	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	41.4	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	41.7	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	5MHz/ Band 5	Intensity, Axial	-18	5.3	PASS
8.3.1			Intensity, Radial	-18	-2.7	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	41.5	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.9	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	10MHz/ Band 5	Intensity, Axial	-18	5.2	PASS
8.3.1			Intensity, Radial	-18	-2.7	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	41.2	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.9	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS

Note: The above summary table represents the worst-case numerical values according to configurations in Table 8-28 and Table 8-29.

Table 8-7
Table of Results for LTE B4 – Ant A

C63.19 Sec.	Mode	BW/Band	Test Description	Minimum Limit*	Measured	Verdict
				dBA/m	*dBA/m*	*PASS/FAIL*
8.3.1	LTE	1.4MHz/ Band 4	Intensity, Axial	-18	5.3	PASS
8.3.1			Intensity, Radial	-18	-2.7	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	42.7	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.2	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	3MHz/ Band 4	Intensity, Axial	-18	5.2	PASS
8.3.1			Intensity, Radial	-18	-2.9	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	42.5	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	43.3	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	5MHz/ Band 4	Intensity, Axial	-18	4.9	PASS
8.3.1			Intensity, Radial	-18	-2.8	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	42.2	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.3	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	10MHz/ Band 4	Intensity, Axial	-18	5.1	PASS
8.3.1			Intensity, Radial	-18	-2.8	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	42.3	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	43.1	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	15MHz/ Band 4	Intensity, Axial	-18	5.0	PASS
8.3.1			Intensity, Radial	-18	-2.8	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	42.9	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.4	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	20MHz/ Band 4	Intensity, Axial	-18	5.3	PASS
8.3.1			Intensity, Radial	-18	-2.6	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	41.1	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.1	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS

Note: The above summary table represents the worst-case numerical values according to configurations in Table 8-32 to Table 8-34.

Table 8-8
Table of Results for LTE B2 – Ant A

C63.19 Sec.	Mode	BW/Band	Test Description	Minimum Limit*	Measured	Verdict
				dBA/m	*dBA/m*	*PASS/FAIL*
8.3.1	LTE	1.4MHz/ Band 2	Intensity, Axial	-18	5.4	PASS
8.3.1			Intensity, Radial	-18	-3.1	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	41.6	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.4	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	3MHz/ Band 2	Intensity, Axial	-18	5.1	PASS
8.3.1			Intensity, Radial	-18	-3.0	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	45.8	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.3	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	5MHz/ Band 2	Intensity, Axial	-18	5.4	PASS
8.3.1			Intensity, Radial	-18	-2.9	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	43.0	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	42.8	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	10MHz/ Band 2	Intensity, Axial	-18	5.4	PASS
8.3.1			Intensity, Radial	-18	-2.9	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	43.6	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	41.6	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	15MHz/ Band 2	Intensity, Axial	-18	5.1	PASS
8.3.1			Intensity, Radial	-18	-2.9	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	42.2	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	43.1	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS
8.3.1	LTE	20MHz/ Band 2	Intensity, Axial	-18	5.3	PASS
8.3.1			Intensity, Radial	-18	-3.0	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	42.6	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	43.2	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS

Note: The above summary table represents the worst-case numerical values according to configurations in Table 8-35 to Table 8-37

II. T-Coil Test Summary (Ant B)

Table 8-11
Table of Results for CDMA – Ant B

C63.19 Sec.	Mode	Band	Test Description	Minimum Limit*	Measured	Verdict
				dBA/m	*dBA/m*	*PASS/FAIL*
8.3.1	CDMA	Secondary Cellular	Intensity, Axial	-18	-1.9	PASS
8.3.1			Intensity, Radial	-18	-8.8	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	44.1	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	43.7	PASS
8.3.2			Frequency Response, Axial	0	1.8	PASS
8.3.1	CDMA	Cellular	Intensity, Axial	-18	-1.0	PASS
8.3.1			Intensity, Radial	-18	-9.1	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	43.4	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	43.0	PASS
8.3.2			Frequency Response, Axial	0	1.7	PASS

Note: The above summary table represents the worst-case numerical values according to configurations in Table 8-18.

Table 8-12
Table of Results for UMTS – Ant B

C63.19 Sec.	Mode	Band	Test Description	Minimum Limit*	Measured	Verdict
				dBA/m	*dBA/m*	*PASS/FAIL*
8.3.1	UMTS	Cellular	Intensity, Axial	-18	0.7	PASS
8.3.1			Intensity, Radial	-18	-7.3	PASS
8.3.4			Signal-to-Noise/Noise, Axial	20	58.2	PASS
8.3.4			Signal-to-Noise/Noise, Radial	20	52.3	PASS
8.3.2			Frequency Response, Axial	0	2.0	PASS

Note: The above summary table represents the worst-case numerical values according to configurations in Table 8-21.

III. Raw Handset Data

Table 8-17
Raw Data Results for CDMA – Ant A

	Volume	Secondary Cellular Band					
		Axial			Radial		
		476	564	684	476	564	684
ABM1, dBA/m	Maximum	-0.83	-1.32	-0.98	-8.15	-8.15	-8.21
ABM2, dBA/m		-44.18	-44.86	-43.99	-49.75	-49.57	-49.62
Ambient Noise, dBA/m		-65.39	-65.39	-65.39	-65.32	-65.32	-65.32
Freq. Response Margin (dB)		1.74	1.79	1.77	N/A	N/A	N/A
S+N/N (dB)		43.35	43.54	43.01	41.60	41.42	41.41
S+N/N per orientation (dB)		43.01			41.41		
C63.19-2011 Rating per orientation		**T4**			**T4**		

	Volume	Cellular Band					
		Axial			Radial		
		1013	384	777	1013	384	777
ABM1, dBA/m	Maximum	-0.08	-0.23	0.07	-8.15	-8.37	-8.45
ABM2, dBA/m		-43.45	-43.32	-40.80	-49.86	-49.31	-47.22
Ambient Noise, dBA/m		-65.39	-65.39	-65.39	-65.32	-65.32	-65.32
Freq. Response Margin (dB)		1.84	1.82	1.85	N/A	N/A	N/A
S+N/N (dB)		43.37	43.09	40.87	41.71	40.94	38.77
S+N/N per orientation (dB)		40.87			38.77		
C63.19-2011 Rating per orientation		**T4**			**T4**		

	Volume	PCS Band					
		Axial			Radial		
		25	600	1175	25	600	1175
ABM1, dBA/m	Maximum	-0.55	-0.06	-0.44	-8.72	-8.80	-8.80
ABM2, dBA/m		-42.55	-44.64	-42.67	-48.17	-50.79	-49.09
Ambient Noise, dBA/m		-65.39	-65.39	-65.39	-65.32	-65.32	-65.32
Freq. Response Margin (dB)		1.88	1.85	1.84	N/A	N/A	N/A
S+N/N (dB)		42.00	44.58	42.23	39.45	41.99	40.29
S+N/N per orientation (dB)		42.00			39.45		
C63.19-2011 Rating per orientation		**T4**			**T4**		
T-coil Coordinates (cm)	[x,y] from bottom left	2.6, 2.6			2.6, 3.3		

Notes:

1. Power Configuration: Power Control Bits = "All Up"
2. Phone Condition: Mute on; Backlight on; Max Volume; Max Contrast
3. Vocoder Configuration: RC1/SO68 (CDMA - EVRC)
4. 'Radial' orientation refers to radial transverse.
5. Speech Signal: 3GPP2 Normal Test Signal
6. Hearing Aid Compatibility mode (**Settings→Accessibility→Hearing→Hearing aids**) was set to ON for Frequency Response compliance.

S+N/N (dB)		45.87	45.70	43.43	45.69	43.74	43.03
S+N/N per orientation (dB)		43.43			43.03		
C63.19-2011 Rating per orientation		**T4**			**T4**		
T-coil Coordinates (cm)	[x,y] from bottom left	2.6, 2.6			2.6, 3.3		

Notes:

1. Power Configuration: Power Control Bits = "All Up"
2. Phone Condition: Mute on; Backlight on; Max Volume; Max Contrast
3. Vocoder Configuration: RC1/SO68 (CDMA - EVRC)
4. 'Radial' orientation refers to radial transverse.
5. Speech Signal: 3GPP2 Normal Test Signal
6. Hearing Aid Compatibility mode (**Settings→Accessibility→Hearing→Hearing aids**) was set to ON for Frequency Response compliance.

Table 8-28
Raw Data Results for LTE B5 (1.4MHz and 3MHz BW's) – Ant A

	Volume	1.4MHz BW	
		Axial	Radial
		20525	20525
ABM1, dBA/m	Maximum	5.27	-2.91
ABM2, dBA/m		-35.34	-46.78
Ambient Noise, dBA/m		-65.39	-65.32
Freq. Response Margin (dB)		2.00	N/A
S+N/N (dB)		40.61	43.87
C63.19-2011 Rating per orientation		**T4**	**T4**
	Volume	3MHz BW	
		Axial	Radial
		20525	20525
ABM1, dBA/m	Maximum	5.29	-2.71
ABM2, dBA/m		-36.14	-44.44
Ambient Noise, dBA/m		-65.39	-65.32
Freq. Response Margin (dB)		2.00	N/A
S+N/N (dB)		41.43	41.73
C63.19-2011 Rating per orientation		**T4**	**T4**
T-coil Coordinates (cm)	[x,y] from bottom left	2.6, 2.6	2.6, 3.3

Notes:

1. Power Configuration: TPC = "Max Power"
2. Radio Configuration: 16QAM, 1RB, 0RB offset
3. Phone Condition: Mute on; Backlight on; Max Volume; Max Contrast
4. Vocoder Configuration: NB AMR 4.75kbps
5. 'Radial' orientation refers to radial transverse.
6. Speech Signal: 3GPP2 Normal Test Signal
7. Hearing Aid Compatibility mode (**Settings→Accessibility→Hearing→Hearing aids**) was set to ON for Frequency Response compliance.
8. The worst case band and bandwidth combination for each probe orientation is additionally tested on the low and high channels for those combinations. LTE Band 5 at 1.4MHz is the worst case for the Axial probe orientation. Please see Table 8-39 for additional tests on the low and high channels for the Axial and Radial probe orientations.

Table 8-38
Raw Data Results for LTE B30 (5MHz and 10MHz BW's) – Ant A

	Volume	5MHz BW	
		Axial	Radial
		27710	27710
ABM1, dBA/m	Maximum	5.19	-2.98
ABM2, dBA/m		-38.22	-43.96
Ambient Noise, dBA/m		-65.39	-65.32
Freq. Response Margin (dB)		2.00	N/A
S+N/N (dB)		43.41	40.98
C63.19-2011 Rating per orientation		**T4**	**T4**
	Volume	10MHz BW	
		Axial	Radial
		27710	27710
ABM1, dBA/m	Maximum	5.14	-2.87
ABM2, dBA/m		-37.19	-43.96
Ambient Noise, dBA/m		-65.39	-65.32
Freq. Response Margin (dB)		2.00	N/A
S+N/N (dB)		42.33	41.09
C63.19-2011 Rating per orientation		**T4**	**T4**
T-coil Coordinates (cm)	[x,y] from bottom left	2.6, 2.6	2.6, 3.3

Notes:

1. Power Configuration: TPC = "Max Power"
2. Radio Configuration: 16QAM, 1RB, 0RB offset
3. Phone Condition: Mute on; Backlight on; Max Volume; Max Contrast
4. Vocoder Configuration: NB AMR 4.75kbps
5. 'Radial' orientation refers to radial transverse.
6. Speech Signal: 3GPP2 Normal Test Signal
7. Hearing Aid Compatibility mode (**Settings→Accessibility→Hearing→Hearing aids**) was set to ON for Frequency Response compliance.
8. The worst case band and bandwidth combination for each probe orientation is additionally tested on the low and high channels for those combinations. LTE Band 30 at 5MHz bandwidth is the worst case for the Radial probe orientation. Please see Table 8-39 for additional tests on the low and high channels for the Axial and Radial probe orientations.

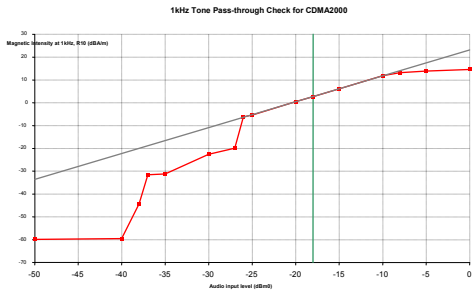
Table 8-39
Raw Data Results for Worst Case LTE Band/BW Combinations by Probe Orientation

	Volume	Band 5			Band 30		
		1.4 MHz			5 MHz BW		
		Axial			Radial		
		20407	20525	20643	27685	27710	27735
ABM1, dBA/m	Maximum	5.30	5.27	5.00	-3.40	-2.98	-2.82
ABM2, dBA/m		-36.58	-35.34	-37.53	-46.22	-43.96	-47.60
Ambient Noise, dBA/m		-65.39	-65.39	-65.39	-65.32	-65.32	-65.32
Freq. Response Margin (dB)		2.00	2.00	2.00	N/A	N/A	N/A
S+N/N (dB)		41.88	40.61	42.53	42.82	40.98	44.78
S+N/N per orientation (dB)		40.61			40.98		
C63.19-2011 Rating per orientation		**T4**			**T4**		
T-coil Coordinates (cm)	[x,y] from bottom left	2.6, 2.6			2.6, 3.3		

Notes:

1. Power Configuration: TPC = "Max Power"
2. Radio Configuration: 16QAM, 1RB, 0RB offset
3. Phone Condition: Mute on; Backlight on; Max Volume; Max Contrast
4. Vocoder Configuration: NB AMR 4.75kbps
5. 'Radial' orientation refers to radial transverse.
6. Speech Signal: 3GPP2 Normal Test Signal
7. Hearing Aid Compatibility mode (**Settings→Accessibility→Hearing→Hearing aids**) was set to ON for Frequency Response compliance.
8. The worst case band and bandwidth combination for each probe orientation is additionally tested on the low and high channels for those combinations. LTE Band 30 at 5MHz bandwidth is the worst case for the Radial probe orientation. LTE Band 5 at 1.4MHz is the worst case for the Axial probe orientation.
9. Both worst case combinations for Axial and Radial orientations are from Ant A.

IV. 1 kHz Vocoder Application Check



This model was verified to be within the linear region for ABM1 measurements at -18 dBm0 for CDMA. This measurement was taken in the axial configuration above the maximum location.

Probe Linearity	2.4%	0.10	Std. Dev.	Normal k=1	1.00	2.4%	
Cable Loss	2.8%	0.12	Specification	Rectangular	1.73	1.6%	
Frequency Analyzer	5.0%	0.21	Specification	Rectangular	1.73	2.9%	
System Repeatability	5.0%	0.21	Std. Dev.	Normal k=1	1.00	5.0%	
WD Repeatability	9.0%	0.37	Std. Dev.	Normal k=1	1.00	9.0%	
Positioner Accuracy	1.0%	0.04	Specification	Rectangular	1.73	0.6%	
Combined standard uncertainty, uc (k=1)						17.7%	0.71
Expanded uncertainty (k=2), 95% confidence level						35.3%	1.31

Notes:

- Test equipments are calibrated according to techniques outlined in NIS81, NIS3003 and NIST Tech Note 1297.
- All equipments have traceability according to NIST. Measurement Uncertainties are defined in further detail in NIS 81 and NIST Tech Note 1297 and UKAS M3003.

Measurement uncertainty reflects the quality and accuracy of a measured result as compared to the true value. Such statements are generally required when stating results of measurements so that it is clear to the intended audience that the results may differ when reproduced by different facilities. Measurement results vary due to the measurement uncertainty of the instrumentation, measurement technique, and test engineer. Most uncertainties are calculated using the tolerances of the instrumentation used in the measurement, the measurement setup variability, and the technique used in performing the test. While not generally included, the variability of the equipment under test also figures into the overall measurement uncertainty. Another component of the overall uncertainty is based on the variability of repeated measurements (so-called Type A uncertainty). This may mean that the Hearing Aid compatibility tests may have to be repeated by taking down the test setup and resetting it up so that there are a statistically significant number of repeat measurements to identify the measurement uncertainty. By combining the repeat measurement results with that of the instrumentation chain using the technique contained in NIS 81 and NIS 3003, the overall measurement uncertainty was estimated.

PCTEST Hearing-Aid Compatibility Facility

DUT: A3LSMG930US

Type: Portable Handset
Serial: 07060

Measurement Standard: ANSI C63.19-2011

Equipment:

- Probe: Radial T-Coil Probe – SN: TEM-1129; Calibrated: 01/29/2015

Test Configuration:

- Mode: LTE Band 2
- Bandwidth: 10MHz
- Channel: 18900
- Antenna Configuration: Ant A

Noise Spectrum

Results

ABM1	-2.85 dB	✔	Minimum	-18.0
ABM2	-44.46 dB	✔	Maximum	0.0
SNNR	41.62 dB	✔	Minimum	20.0

Certificate of Calibration

for

Axial T Coil Probe

Manufactured by:	TEM CONSULTING
Model No:	Axial T Coil Probe
Serial No:	TEM-1123
Calibration Recall No:	24931

Submitted By:

Customer:	ANDREW HARWELL
Company:	PCTEST ENGINEERING LAB
Address:	6660-B DOBBIN ROAD COLUMBIA MD 21045

The subject instrument was calibrated to the indicated specification using standards traceable to the National Institute of Standards and Technology or to accepted values of natural physical constants. This document certifies that the instrument met the following specification upon its return to the submitter.

West Caldwell Calibration Laboratories Procedure No. Axial T Coi TEM

Upon receipt for Calibration, the instrument was found to be:

Within (X)

tolerance of the indicated specification. See attached Report of Calibration.

VASH
3/17/2015

West Caldwell Calibration Laboratories' calibration control system meets the requirements, ISO 10012-1 MIL-STD-45662A, ANSI/NCSL Z540-1, IEC Guide 25, ISO 9001:2008 and ISO 17025.

Note: With this Certificate, Report of Calibration is included.

Approved by:

Calibration Date: 29-Jan-15

13. CONCLUSION

The measurements taken in accordance with the procedures provided in the CTIA Test Plan for Hearing Aid Compatibility Rev 3.0, November 2013, indicate that the wireless communications device complies with the HAC limits specified in the ANSI C63.19 Standard and FCC WT Docket No. 01-309 RM-8658. Precise laboratory measures were taken to assure repeatability of the tests. The tested device complies with the requirements in respect to all parameters specific to the test. The test results and statements relate only to the item(s) tested.

The measurement system and techniques presented in this evaluation are proposed in the ANSI standard as a means of best approximating wireless device compatibility with a hearing-aid. The literature is under continual re-construction.
