7.3 Spurious and Harmonic Emissions at Antenna Terminal

Test Overview

The level of the carrier and the various conducted spurious and harmonic frequencies is measured by means of a calibrated spectrum analyzer. The spectrum is scanned from the lowest frequency generated in the equipment up to a frequency including its 10th harmonic. All out of band emissions are measured with a spectrum analyzer connected to the antenna terminal of the EUT while the EUT is operating at its maximum duty cycle, at maximum power, and at the appropriate frequencies. All data rates were investigated to determine the worst case configuration. All modes of operation were investigated and the worst case configuration results are reported in this section.

The minimum permissible attenuation level of any spurious emission is 43 + 10 $\log_{10}(P_{[Watts]})$, where P is the transmitter power in Watts.

Test Procedure Used

KDB 971168 D01 v03r01 – Section 6.0

Test Settings

1. Start frequency was set to 30MHz and stop frequency was set to at least 10 * the fundamental frequency (separated into at least two plots per channel)
2. Detector = RMS
3. Trace mode = trace average
4. Sweep time = auto couple
5. The trace was allowed to stabilize
6. Please see test notes below for RBW and VBW settings

Test Setup

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 7-2. Test Instrument & Measurement Setup

Test Notes

Compliance with the applicable limits is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater for frequencies less than 1 GHz and 1 MHz or greater for frequencies greater than 1 GHz. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emission are attenuated at least 26 dB below the transmitter power.

7.4 Band Edge Emissions at Antenna Terminal

Test Overview

All out of band emissions are measured with a spectrum analyzer connected to the antenna terminal of the EUT while the EUT is operating at its maximum duty cycle, at maximum power, and at the appropriate frequencies. All data rates were investigated to determine the worst case configuration. All modes of operation were investigated and the worst case configuration results are reported in this section.

The minimum permissible attenuation level of any spurious emission is 43 + 10 $\log_{10}(P_{[Watts]})$, where P is the transmitter power in Watts.

For LTE B13, the minimum permissible attenuation level of all emissions in the 763 – 775MHz and 793 – 805MHz band is 65 + 10 $\log_{10}(P_{[Watts]})$ in a 6.25kHz bandwidth, where P is the transmitter power in Watts.

For LTE B30, the minimum permissible attenuation levels are 43 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2305 and 2320 MHz and on all frequencies between 2345 and 2360 MHz that are outside the licensed band(s) of operation, 55 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2320 and 2324 MHz and on all frequencies between 2341 and 2345 MHz, 61 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2324 and 2328 MHz and on all frequencies between 2337 and 2341 MHz, 67 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2328 and 2337 MHz, 43 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2300 and 2305 MHz, 55 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2296 and 2300 MHz, 61 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2292 and 2296 MHz, 67 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2288 and 2292 MHz, 70 + 10 log ($P_{[Watts]}$) dB below 2288 MHz, 43 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2360 and 2365 MHz, and 70 + 10 log ($P_{[Watts]}$) dB above 2365 MHz.

For LTE B7, B41/38, the minimum permissible attenuation levels are 40 + 10 log ($P_{[Watts]}$) dB on all frequencies between the channel edge and 5 megahertz from the channel edge, 43 + 10 log ($P_{[Watts]}$) dB on all frequencies between 5 megahertz and X megahertz from the channel edge, and 55 + 10 log ($P_{[Watts]}$) dB on all frequencies more than X megahertz from the channel edge, where X is the greater of 6 megahertz or the actual emission bandwidth. In addition, the minimum permissible attenuation levels shall not be less than 43 + 10 log ($P_{[Watts]}$) dB on all frequencies between 2490.5 MHz and 2496 MHz and 55 + 10 log ($P_{[Watts]}$) dB at or below 2490.5 MHz.

Test Procedure Used

KDB 971168 D01 v03r01 – Section 6.0

Test Settings

1. Start and stop frequency were set such that the band edge would be placed in the center of the plot
2. Span was set large enough so as to capture all out of band emissions near the band edge
3. RBW ≥ 1% of the emission bandwidth
4. VBW ≥ 3 x RBW
5. Detector = RMS
6. Number of sweep points ≥ 2 x Span/RBW
7. Trace mode = trace average
8. Sweep time = auto couple
9. The trace was allowed to stabilize

Test Setup

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 7-3. Test Instrument & Measurement Setup

Test Notes

Per 22.917(b) 24.238(a) 27.53(h) in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed to demonstrate compliance with the out-of-band emissions limit. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emission are attenuated at least 26 dB below the transmitter power.

Per 27.53(g) for operations in the 698-746 MHz band, in the 100 kHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least 30 kHz may be employed to demonstrate compliance with the out-of-band emissions limit.

Per 27.53(c)(5) for operations in the 776-788 MHz band, in the 100 kHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least 30 kHz may be employed to demonstrate compliance with the out-of-band emissions limit.

For all plots showing emissions in the 763 – 775MHz and 793 – 805MHz band, the FCC limit per 27.53(c)(4) is 65 + 10 $\log_{10}(P)$ = -35dBm in a 6.25kHz bandwidth.
