TEST REPORT

EUT Description	**WLAN and BT, 2x2 PCIe M.2 1625 adapter card**
Brand Name	**Intel® Wi-Fi 6E AX411**
Model Name	**AX411E2W**
FCC ID	**PD9AX411E2**
Date of Test Start/End	**2021-07-27 / 2021-08-30**
Features	**802.11ax, Tri Band, 2x2 Wi-Fi 6E + Bluetooth® 5.2 + CDB (Concurent Dual Band simultaneous wi-fi connection)** (see section 5)
Description	**WLAN setup + PIFA antenna**

Applicant	**Intel Mobile Communications**
Address	**100 Center Point Circle, Suite 200 / Columbia, SC 29210 / United States**
Contact Person	**Steven Hackett**
Telephone/Fax/ Email	**steven.c.hackett@intel.com**

Reference Standards	**FCC 47 CFR Part §2.1093** (see section 1)	
RF Exposure Environment	**Portable devices - General population/uncontrolled exposure**	
	Testing Result	Limit
Maximum Power Density Result & Limit	**2.04 W/m² (4cm²)**	**10 W/m² (4cm²)**
Maximum SAR Result & Limit	**0.29 W/kg (1g)**	**1.6 W/kg (1g)**
Min. test separation distance	**15mm**	

Test Report identification	**210611-03.TR40**
Revision Control	**Rev. 00** **This test report revision replaces any previous test report revision** (see section 8)

The test results relate only to the samples tested.

2. General conditions, competences and guarantees

- ✓ Intel Corporation SAS Wireless RF Lab (Intel WRF Lab) is an Accredited Test Firm recognized by the FCC.
- ✓ Intel WRF Lab declines any responsibility with respect to the identified information provided by the customer and that may affect the validity of results.
- ✓ Intel WRF Lab only provides testing services and is committed to providing reliable, unbiased test results and interpretations.
- ✓ Intel WRF Lab is liable to the client for the maintenance of the confidentiality of all information related to the item under test and the results of the test.
- ✓ Intel WRF Lab has developed calibration and proficiency programs for its measurement equipment to ensure correlated and reliable results to its customers.
- ✓ This report is only referred to the item that has undergone the test.
- ✓ This report does not imply an approval of the product by the Certification Bodies or competent Authorities.

3. Environmental Conditions

✓ At the site where the measurements were performed the following limits were not exceeded during the tests:

Temperature	23.0ºC ± 2ºC
Humidity	44.4% ± 10%
Liquid Temperature	20.1ºC ± 2ºC

4. Test samples

Sample	Control #	Description	Model	Serial #	Date of receipt
#01	210611-03. S18	WLAN and BT, 2x2 PCIe M.2 1625 adapter card	AX411E2W	WFM: 3413E8F11F3A	2021-07-13

Additional Information

No WWAN transmitter is considered in this report

5.60-5.65 GHz band (TDWR) is supported by the device

Band gap is supported by the device

*Only these bands are treated on this document since this report is limited to WiFi 6E capabilities

Supported Radios

Mode	Duty Cycle	Modulation	Band	UL Freq Range (MHz)	Measured Max. Conducted Power (dBm)
802.11ax	100%	BPSK QPSK 16QAM 64QAM 256QAM	6.2GHz	5955-6415	13.27
802.11ax	100%	BPSK QPSK 16QAM 64QAM 256QAM	6.5GHz	6435-6515	13.12
802.11ax	100%	BPSK QPSK 16QAM 64QAM 256QAM	6.7GHz	6535-6855	13.38
802.11ax	100%	BPSK QPSK 16QAM 64QAM 256QAM	7.0GHz	6875-7115	12.91

NM: Not Measured

Maximum Output power specification + Tune up tolerance limit (Provided by customer)			SISO mode	
Equipment Class	Mode	BW (MHz)	Chain A (dBm)	Chain B (dBm)
U-NII-5	802.11ax	20/40/80/160	13.50	13.50
U-NII-6	802.11ax	20/40/80/160	13.50	13.50
U-NII-7	802.11ax	20/40/80/160	13.50	13.50
U-NII-8	802.11ax	20/40/80/160	13.00	13.00

6. Remarks and comments

1. The conducted values are obtained by applying the available power table to the AX411E2W Intel module installed in the WLAN setup identified in this report, as requested by the customer
2. Only the plots for the test positions with the highest measured SAR/PD per band/mode are included in Annex C
3. This report reference only to 6GHz WLAN measurements, other relevant WLAN results can be found in the following report *210611-03.TR07 - FCC-SAR Legacy, AX411E2W*

7. Test Verdicts summary

The statement of conformity to applicable standards in the table below are based on the measured values, without taking into account the measurement uncertainties.

Standard	Band	Highest Reported SAR [W/kg] 1g	Verdict
802.11ax	6.2GHz	0.23	P
802.11ax	6.5GHz	0.29	P
802.11ax	6.7GHz	0.24	P
802.11ax	7.0GHz	0.29	P

Standard	Band	Highest Reported PS_{tot} avg [W/m^2] 4cm^2	Verdict
802.11ax	6.2GHz	2.00	P
802.11ax	6.5GHz	2.04	P
802.11ax	6.7GHz	0.87	P
802.11ax	7.0GHz	0.97	P

P: Pass
F: Fail
NM: Not Measured
NA: Not Applicable

According to the FCC OET KDB 690783 D01, this is the summary of the values for the Grant Listing:

Highest Reported SAR (1g) (W/kg)			
Exposure Condition	Equipment Class		
	DTS	DSS	U-NII*
Body Worn	0.27	0.03	0.29
Simultaneous Tx	Sum-SAR: 1.07	Sum-SAR: 0.57	Sum-SAR: 1.07

*Limited to 6E bands

Considering the results of the performed test according to FCC 47CFR Part 2.1093 the item under test is IN COMPLIANCE with the requested specifications specified in Section1. Standards, reference documents and applicable test methods

8. Document Revision History

Revision #	Modified by	Revision Details
Rev. 00	A.Dihissou M.Lefebvre	First Issue

Annex A. PD Test & System Description

A.1 Power Density Definition

The power density for an electromagnetic field represents the rate of energy transfer per unit area.
The local power density (i.e. Poynting vector) at a given spatial point is deduced from electromagnetic fields by the following formula:

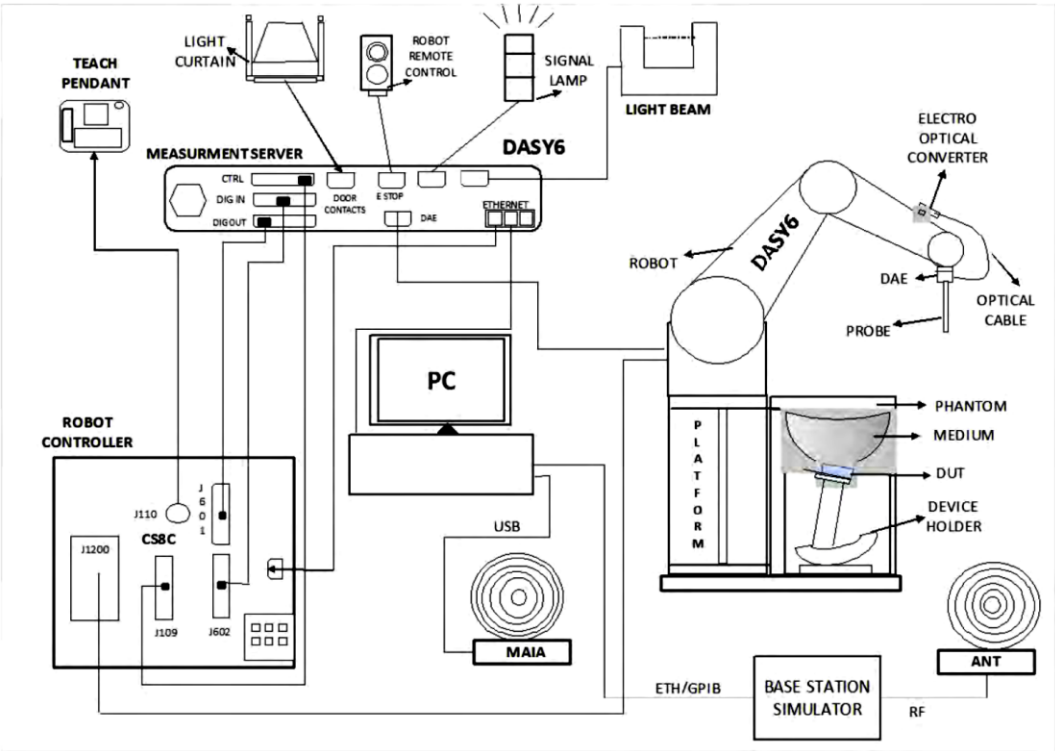
$$\overrightarrow{P_{local}} = \frac{1}{2}\mathrm{Re}\left(\vec{E} \times \vec{H}^*\right)$$

Where $\vec{E}$ is the complex electric field peak phasor and $\vec{H}^*$ is the complex conjugate magnetic field peak phasor.
This power density is also called “single-point” or “spot power density”.
Considering that the FCC’s Maximum Permissible Exposure (MPE) limit is applicable on the average power density inside 1cm^2 area, the single point power densities in the evaluation plane should be averaged inside the 1cm^2 area.

A.2 SPEAG free space Measurement System

A.2.1 Measurement Setup

The DASY6 system for performing compliance tests consists of the following items:



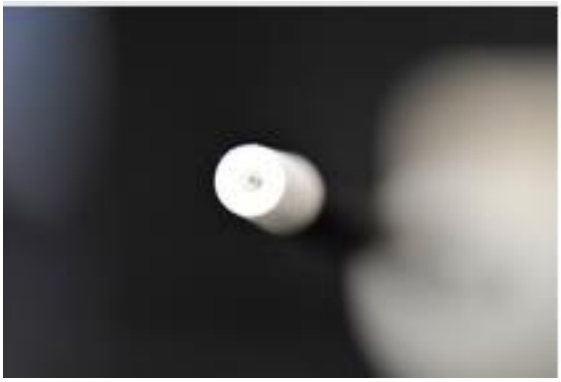
- ✓ A standard high precision 6-axis robot (Staübli TX/RX family) with controller, teach pendant and software. It includes an arm extension for accommodating the data acquisition electronics (DAE)
- ✓ An mm-wave E-field probe optimized and calibrated for the targeted measurements.
- ✓ A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- ✓ The Electro-optical Converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. The EOC signal is transmitted to the measurement server.
- ✓ The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movements interrupts.
- ✓ The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- ✓ A computer running Win7 professional operating system and the cDASY6 software.
- ✓ Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.

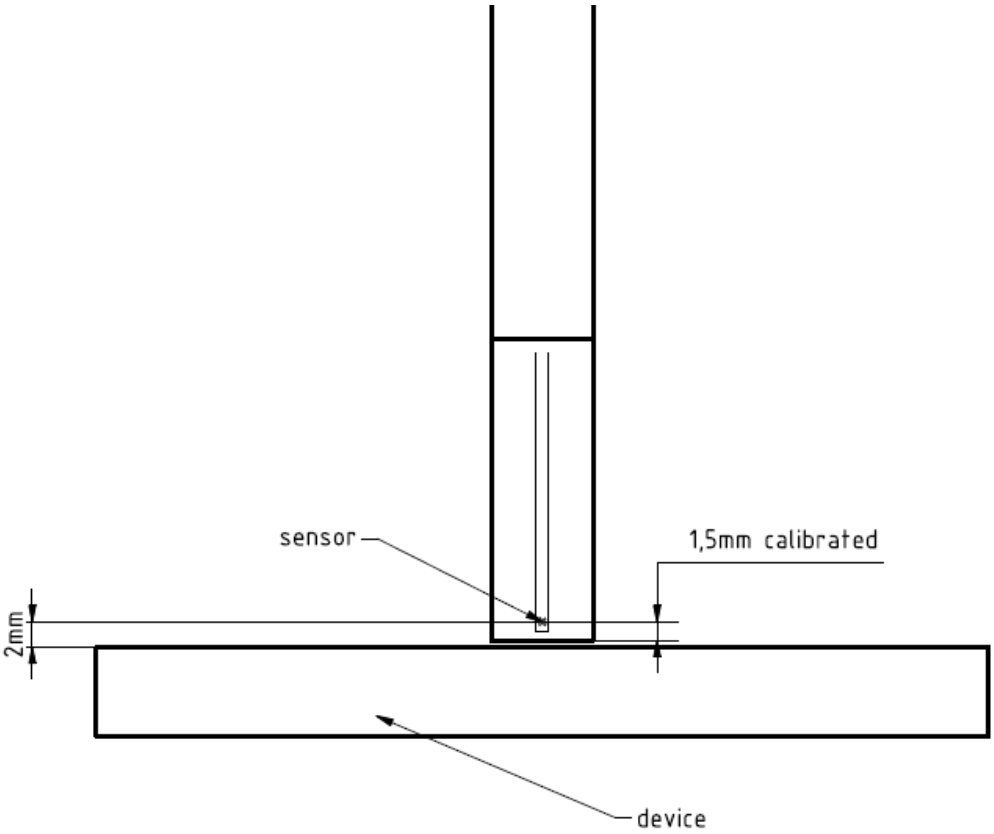
A.2.2 E-Field Measurement Probe

The probe consists of two dipoles (0.8 mm length) optimally arranged with different angles (γ_1 and γ_2) to obtain pseudo-vector information, printed on glass substrate protected by high density foam that allows low perturbation of the measured field.
Three or more measurements are taken for different probe rotational angles, deriving the amplitude and polarization information.

The probe's characteristics are:

Frequency Range	750 MHz – 110 GHz
Length	320 mm
Probe tip external diameter	8 mm
Probe's two dipoles length	0.9mm – Diode loaded
Probe's substrate	Quartz 0.9 x 20 x 0.18mm (εr=3.8)
Distance between diode sensors and probe's tip	1.5 mm
Axial Isotropy	±0.6 dB
Maximum operating E-field	3000 V/m
Lower E-field detection threshold	5 V/m @ 60 GHz
Minimum Mechanical separation between probe tip and a Surface	0.5mm
Calibration reference point	Diode Sensor





A.2.3 Worst Case Linearization Error

For continuously transmitting signals (100% duty cycle), the worst case linearization error is given by the difference between non linearized voltage and linearized voltage using CW parameters. The error is increasing with the voltage levels. In our particular case, the measured voltages averaged over the signal period are below 1mV. We use 1mV in the below calculation to have the worst case condition. The signal PAR (Peak to Average Ratio) is 6dB and the diode compression point 100mV.

The maximum voltage through the diode is given by:

$$\text{vpeak} = \text{vmeas avg} \times \text{PARlinear}$$
$$vpeak = 1 * 4 = 4\ mV$$

The linearized voltage using CW parameter is given by:

$$vlin\ peak = vpeak + \frac{v_{peak}^2}{diode\ compression\ point}$$
$$vlin\ peak = 4 + \frac{4^2}{100} = 4.16\ mV$$

The worst case linearization error is:

$$lin\ error = \frac{vlin\ peak}{v\ peak} = \frac{4.16}{4} = 1.04 = 4\%$$

A.2.4 Data Evaluation

A.2.4.1 Scan

The scan involves the measurement of two planes with three different probe rotations. The grid steps are optimized by the software based on the test frequency. The location of the lowest measurement plane is defined by the distance of first measurement layer from device under test (DUT) entered by the user. The DUT location settings can be used to offset the center of the grid.

A.2.4.2 Total Field and Power Flux Density Reconstruction

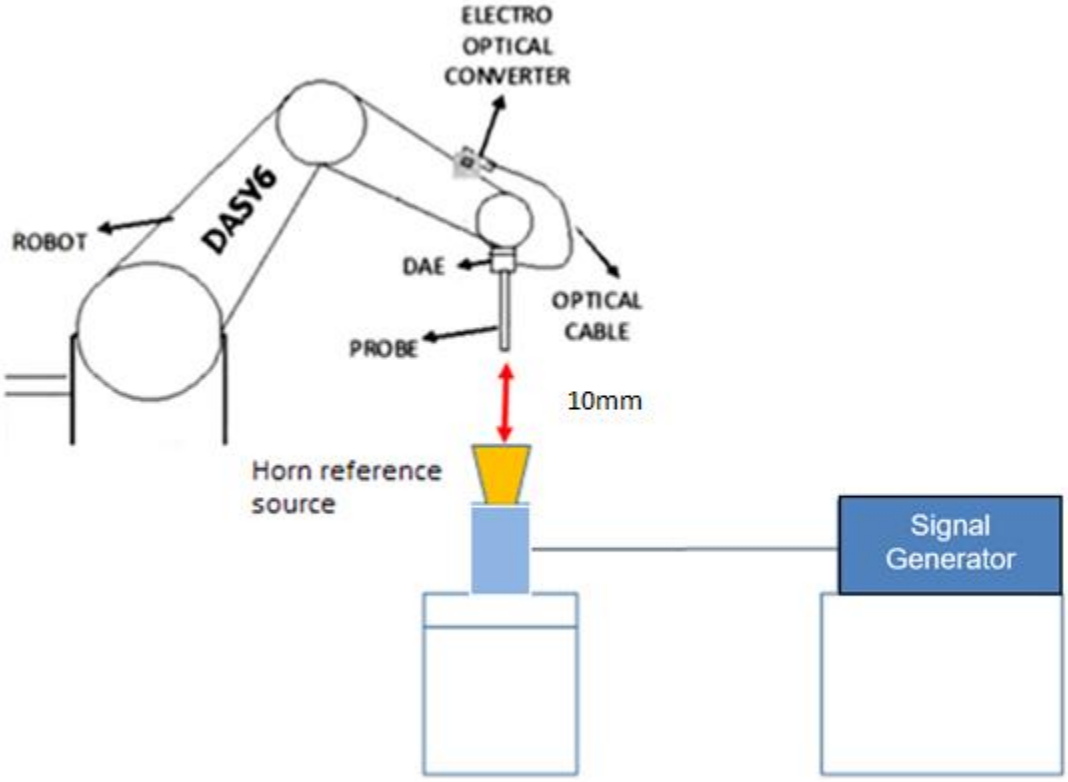
Computation of the power density in general requires knowledge of the electric (E-) and magnetic (H-) field amplitudes and phases in the plane of incidence. Reconstruction of these quantities from pseudo-vector E-field measurements is feasible, as they are constrained by Maxwell's equations.
The reconstruction algorithm developed by the system manufacturer, together with the ability of the probe to measure extremely close to the source without perturbing the field, permits reconstruction of the E- and H-fields, as well as of the power density, on measurement planes located as near as 0.5mm away in the frequency band of 60 GHz.

The average of the reconstructed power density is evaluated over a circular area in each measurement plane. The area of the circle is defined by the user; the default is 1 cm^2.

A.3 System Check

The system performance check verifies that the system operates within its specifications. It is recommended that the system performance check be performed prior to any usage of the system in order to guarantee reproducible results.
The system performance check uses normal E-field measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of the components, but indicates situations where the system uncertainty is exceeded due to drift or failure.
In the simplified setup for system check, the EUT is replaced by a calibrated source and the power source is replaced by a controlled continuous wave generated by a signal generator. The calibrated source must be placed at the correct distance from the E-field probe according to the calibration certificate.

First, the power meter is connected to the output of the signal generator to measure the forward power at the location of the connector to the system check source. The signal generator is adjusted for the desired forward power to match the system check source calibration setup at the connector as read by power meter. Then the power meter is replaced by the system check source.



The output power on the reference source is set to 10.0 dBm (10 mW) and the measurement results E, H and Avg PD are compared with the Numerical modeling.

A.6 RF Exposure Limits

Power density assessments have been made in line with the requirements of FCC 47CFR Part 2.1093, in particular chapter 1.1310 specifying the MPE limits, on the limitation of exposure of the general population / uncontrolled exposure for portable devices.

Exposure Type	Power density (S)
Limits for Occupational/Controlled Exposure. 1.5GHz – 100GHz	**50.0 W/m^2**
Limits for General Population/ Uncontrolled Exposure. 1.5GHz – 100GHz	**10.0 W/m^2**

Annex B. SAR Test & System Description

B.1 SAR Definition

Specific Absorption rate is defined as the time derivative of the incremental energy (dW) absorbed by (dissipated in) and incremental mass (dm) contained in a volume element (dV) of a given density (ρ).

$$SAR = \frac{d}{dt} \cdot \left(\frac{dW}{dm}\right) = \frac{d}{dt} \cdot \left(\frac{dW}{\rho \cdot dV}\right)$$

SAR is expressed in units of watts per kilogram (W/kg). SAR can be related to the electric field at a point by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

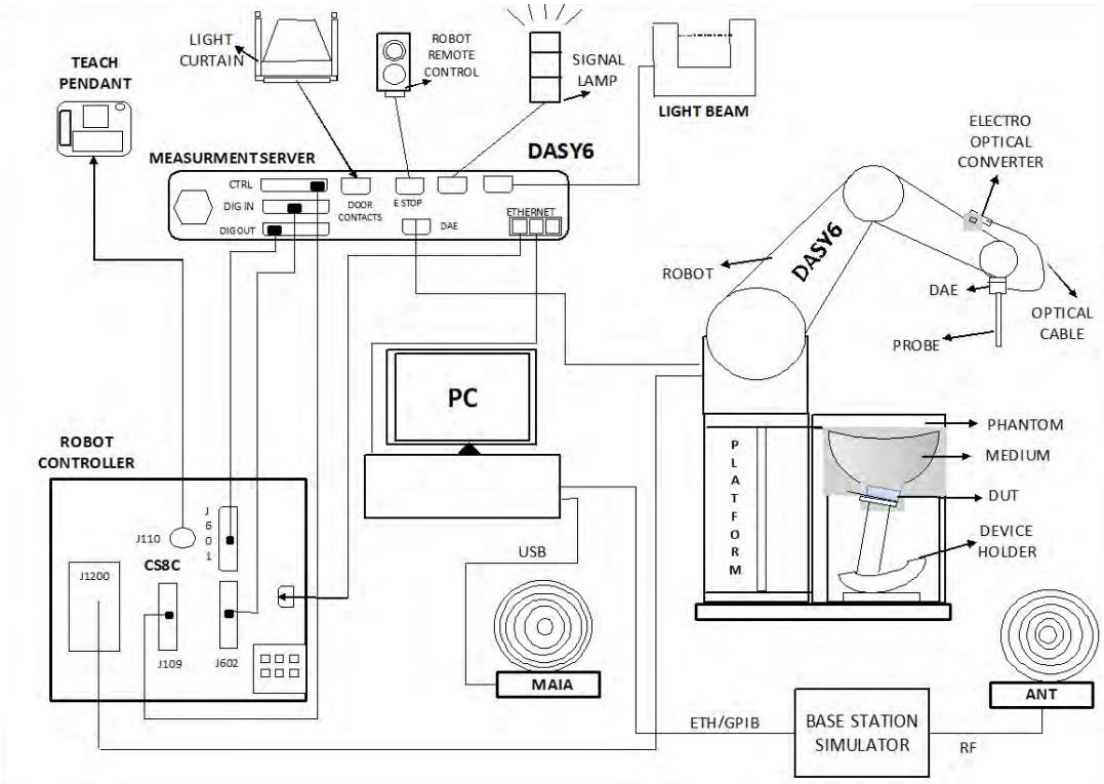
Where:

σ = Conductivity of the tissue (S/m)
ρ = Mass density of the tissue (kg/m3)
E = RMS electric field strength (V/m)

B.2 SPEAG SAR Measurement System

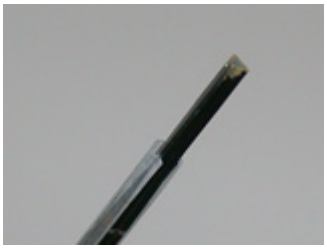
B.2.1 SAR Measurement Setup

The DASY6 system for performing compliance tests consists of the following items:



- ✓ A standard high precision 6-axis robot (Staübli TX/RX family) with controller, teach pendant and software. It includes an arm extension for accommodating the data acquisition electronics (DAE)
- ✓ An isotropic field probe optimized and calibrated for the targeted measurements.
- ✓ A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- ✓ The Electro-optical Converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. The EOC signal is transmitted to the measurement server.
- ✓ The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movements interrupts.
- ✓ The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- ✓ A computer running Win7 professional operating system and the DASY6 software.
- ✓ Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- ✓ The phantom, the device holder and other accessories according to the targeted measurement.
- ✓ MAIA is a hardware interface (Antenna) used to evaluate the modulation and audio interference characteristics of RF signals.
- ✓ ANT is an ultra-wideband antenna for use with the base station simulators over 698 MHz to 6GHz for SAR cellular testing (not used for WLAN testing).
- ✓ The base station simulator is an equipment used for SAR cellular tests in order to emulate the cellular signals characteristics and behavior between a regular base station and the equipment under test.
- ✓ Tissue simulating liquid.
- ✓ System Validation dipoles.
- ✓ Network emulator or RF test tool

B.2.2 E-Field Measurement Probe



The probe is constructed using three orthogonal dipole sensors arranged on an interlocking, triangular prism core. The probe has built-in shielding against static charges and is contained within a PEEK cylindrical enclosure material at the tip.

The probe's characteristics are:

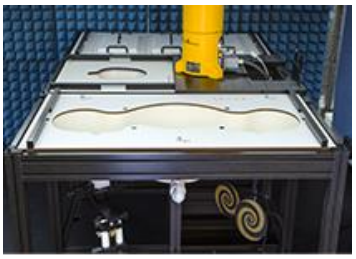
Frequency Range	30MHz – 10GHz
Length	337 mm
Probe tip external diameter	2.5 mm
Typical distance between dipoles and the probe tip	1 mm
Axial Isotropy (in human-equivalent liquids)	±0.3 dB
Hemispherical Isotropy (in human-equivalent liquids)	±0.5 dB
Linearity	±0.2 dB
Maximum operating SAR	100 W/kg
Lower SAR detection threshold	0.001 W/kg

B.2.3 SAM Phantom

The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528 and IEC 62209-1. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by teaching three points with the robot.

The phantom's characteristics are:

Material	Vinylester, glass fiber reinforced (VE-GF)
Shell thickness	2 mm ± 0.2 mm
Shell thickness at ERP	6 ± 0.2 mm
Filling volume	25 Liters
Dimensions	Length: 1000mm / Width: 500mm

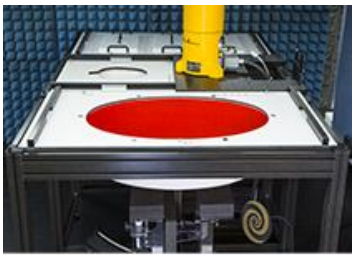


B.2.4 Flat Phantom

Phantom for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 10 GHz. ELI is fully compatible with the IEC 62209-2 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all SPEAG dosimetric probes and dipoles.

The phantom's characteristics are:

Material	Vinylester, glass fiber reinforced (VE-GF)
Shell thickness	2 mm ± 0.2 mm
Filling volume	30 Liters approx.
Dimensions	Major axis: 600mm / Minor axis: 400mm



B.2.5 Device Positioner

The SAR in the phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source at 5 mm distance, a positioning uncertainty of 0.5 mm would produce a SAR uncertainty of 20%. Accurate device positioning is therefore crucial for accurate and repeatable measurements. The positions in which the devices must be measured are defined by the standards.

The DASY device holder is designed to cope with the different positions given in the standard. It has two scales for device rotation (with respect to the body axis) and device inclination (with respect to the line between the ear reference points). The rotation center for both scales is the ear reference point (ERP). Thus the device needs no repositioning when changing the angles.

The DASY device holder is constructed of low-loss POM material having the following dielectric parameters: relative permittivity ε=3 and loss tangent δ=0.02. The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

A simple but effective and easy-to-use extension for the Mounting Device; facilitates testing of larger devices according to IEC 62209-2 (e.g., laptops, cameras, etc.); lightweight and fits easily on the upper part of the Mounting Device in place of the phone positioner. The extension is fully compatible with the Twin SAM, ELI and other Flat Phantoms.

B.3 Data Evaluation

- **Power Reference measurement**

The robot measures the E field in a specified reference position that can be either the selected section's grid reference point or a user point in this section at 4mm of the inner surface of the phantom, 2mm for frequencies above 3GHz.

- **Area Scan**

Measurement procedures for evaluating SAR from wireless handsets typically start with a coarse measurement grid to determine the approximate location of the local peak SAR values. This is known as the area-scan procedure. The SAR distribution is scanned along the inside surface of one side of the phantom head, at least for an area larger than the projection of the handset and antenna. The distance between the measured points and phantom surface should be less than 8 mm, and should remain constant (with variation less than ± 1 mm) during the entire scan in order to determine the locations of the local peak SAR with sufficient accuracy. The angle between the probe axis and the surface normal line is recommended but not required to be less than 30°. If this angle is larger than 30° and the closest point on the probe-tip housing to the phantom surface is closer than a probe diameter, the boundary effect may become larger and polarization dependent. This additional uncertainty needs to be analyzed and accounted for. To achieve this, modified test procedures and additional uncertainty analyses not described in this recommended practice may be required. The measurement and interpolation point spacing should be chosen such as to allow identification of the local peak locations to within one-half of the linear dimension of a side of the zoom-scan volume. Because a local peak having specific amplitude and steep gradients may produce a lower peak spatial-average SAR compared to peaks with slightly lower amplitude and less steep gradients, it is necessary to evaluate these other peaks as well. However, since the spatial gradients of local SAR peaks are a function of the wavelength inside the tissue-equivalent liquid and the incident magnetic field strength, it is not necessary to evaluate local peaks that are less than 2 dB or more below the global maximum peak. Two-dimensional spline algorithms (Brishoual et al. 2001; Press et al., 1996) are typically used to determine the peaks and gradients within the scanned area. If a peak is found at a distance from the scan border of less than one-half the edge dimension of the desired 1 g or 10 g cube, the measurement area should be enlarged if possible.

- **Zoom Scan**

To evaluate the peak spatial-average SAR values for 1 g or 10 g cubes, fine resolution volume scans, called zoom scans, are performed at the peak SAR locations identified during the area scan. The minimum zoom scan volume size should extend at least 1.5 times the edge dimension of a 1 g cube in all directions from the center of the scan volume, for both 1 g and 10 g peak spatial-average SAR evaluations. Along the phantom curved surfaces, the front face of the volume facing the tissue/liquid interface conforms to the curved boundary, to ensure that all SAR peaks are captured. The back face should be equally distorted to maintain the correct averaging mass. The flatness and orientation of the four side faces are unchanged from that of a cube whose orientation is within ± 30° of the line normal to the phantom at the center of the cube face next to the phantom surface. The peak local SAR locations that were determined in the area scan (interpolated values) should be used for the centers of the zoom scans. If a scan volume cannot be centered due to proximity of a phantom shape feature, the probe should be tilted to allow scan volume enlargement. If probe tilt is not feasible, the zoom-scan origin may be shifted, but not by more than half of the 1 g or 10 g cube edge dimension.

After the zoom-scan measurement, extrapolations from the closest measured points to the surface, for example along lines parallel to the zoom-scan centerline, and interpolations to a finer resolution between all measured and extrapolated points are performed. Extrapolation algorithm considerations are described in 6.5.3, and 3-D spline methods (Brishoual et al., 2001; Kreyszig, 1983; Press et al., 1996) can be used for interpolation. The peak spatial-average SAR is finally determined by a numerical averaging of the local SAR values in the interpolation grid, using for example a trapezoidal algorithm for the integration (averaging).

In some areas of the phantom, such as the jaw and upper head regions, the angle of the probe with respect to the line normal to the surface may be relatively large, e.g., greater than ± 30º, which could increase the boundary effect error to a larger level. In these cases, during the zoom scan a change in the orientation of the probe, the phantom, or both is recommended but not required for the duration of the zoom scan, so that the angle between the probe axis and the line normal to the surface is within 30º for all measurement points.

- **Power Drift measurement**

The robot re-measures the E-Field in the same reference location measured at the Power Reference. The drift measurement gives the field difference in dB from the first to the last reference reading. This allows a user to monitor the power drift of the device under test that must remain within a maximum variation of ±5%.

- **Post-processing**

The procedure for spatial peak SAR evaluation has been implemented according to the IEEE1528 and IEC 62209-1/2 standards. It can be conducted for 1g and 10g.

The software allows evaluations that combine measured data and robot positions, such as:

- ✓ Maximum search
- ✓ Extrapolation
- ✓ Boundary correction
- ✓ Peak search for averaged SAR

Interpolation between the measured points is performed when the resolution of the grid is not fine enough to compute the average SAR over a given mass.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation is determined by the surface detection distance and the probe sensor offset. Several measurements at different distances are necessary for the extrapolation.

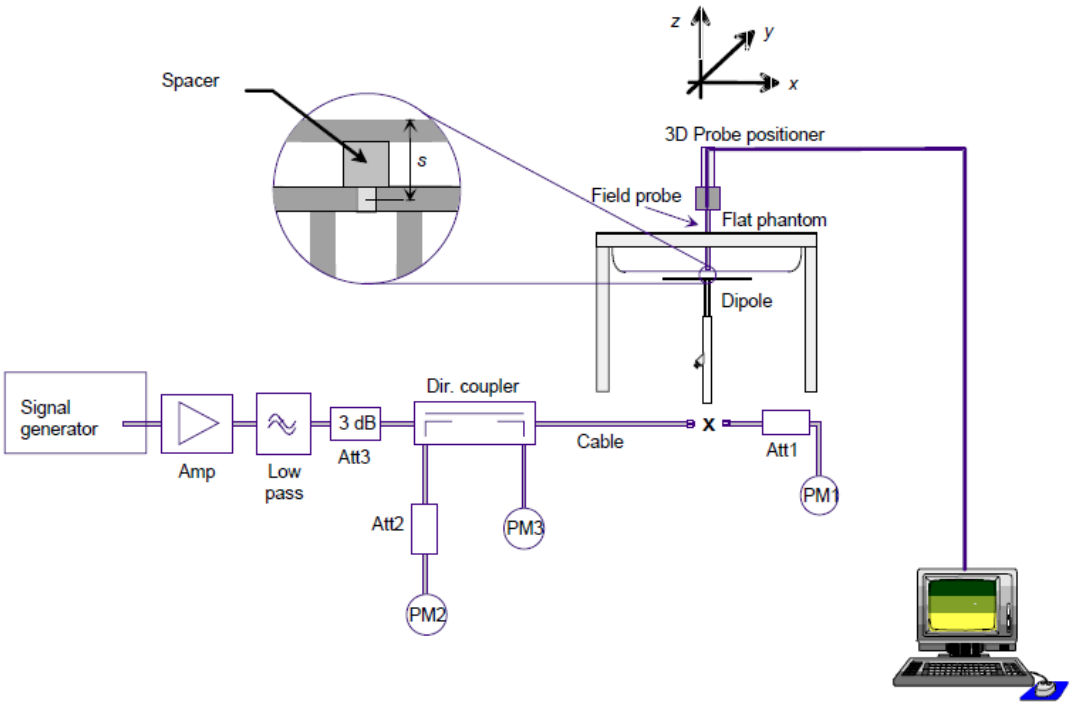
B.4 System and Liquid Check

B.4.1 System Check

The system performance check verifies that the system operates within its specifications. System and operator errors can be detected and corrected. It is recommended that the system performance check be performed prior to any usage of the system in order to guarantee reproducible results.

The system performance check uses normal SAR measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of the components, but indicates situations where the system uncertainty is exceeded due to drift or failure.

In the simplified setup for system check, the EUT is replaced by a calibrated dipole and the power source is replaced by a controlled continuous wave generated by a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the phantom at the correct distance.



The equipment setup is shown below:

- ✓ Signal Generator
- ✓ Amplifier
- ✓ Directional coupler
- ✓ Power meter
- ✓ Calibrated dipole

First, the power meter PM1 (including attenuator Att1) is connected to the cable to measure the forward power at the location of the connector (x) to the system check source. The signal generator is adjusted for the desired forward power at the connector as read by power meter PM1 after attenuation Att1 and also as coupled through Att2 to PM2. After connecting the cable to the source, the signal generator is readjusted for the same reading at power meter PM2.

SAR results are normalized to a forward power of 1W to compare the values with the calibration reports results as described at IEEE 1528 and IEC 62209 standards.

B.4.2 Liquid Check

The dielectric parameters check is done prior to the use of the tissue simulating liquid. The verification is made by comparing the relative permittivity and conductivity to the values recommended by the applicable standards.

The liquid verification was performed using the following test setup:

- ✓ VNA (Vector Network Analyzer)
- ✓ Open-Short-Load calibration kit
- ✓ RF Cable
- ✓ Open-Ended Coaxial probe
- ✓ DAK software tool
- ✓ SAR Liquid
- ✓ De-ionized water
- ✓ Thermometer

These are the target dielectric properties of the tissue-equivalent liquid material according to the manufacturer's datasheet:

Frequency	Head Tissue Simulating Medium	
(MHz)	ε_r (F/m)	σ (S/m)
6000	35.07	5.48
6500	34.46	6.07
7000	33.88	6.65

(ε_r = relative permittivity, σ = conductivity and ρ = 1000 kg/m3)

The measurement system implement a SAR error compensation algorithm as documented in IEEE Std 1528-2013 (equivalent to draft standard IEEE P1528-2011) to automatically compensate the measured SAR results for deviations between the measured and required tissue dielectric parameters (applied to only scale up the measured SAR, and not downward) so, according to FCC OET KDB 865664 D01, the tolerance for ε_r and σ may be relaxed to ± 10%.

B.7 RF Exposure Limits

SAR assessments have been made in line with the requirements of FCC 47CFR Part 2.1093 on the limitation of exposure of the general population / uncontrolled exposure for portable devices.

Exposure Type	General Population / Uncontrolled Environment
Peak spatial-average SAR (averaged over any 1 gram of tissue)	**1.6 W/kg**
Whole body average SAR	**0.08 W/kg**
Peak spatial-average SAR (extremities) (averaged over any 10 grams of tissue)	**4.0 W/kg**

Annex C. Test Results

Test case measurement	Test Personnel
Conducted measurement	A. Dihissou
SAR/PD measurement	A. Dihissou / M.Lefebvre

C.1 Test Conditions

C.1.1 Test positions relative to the phantom

The device under test was an Intel® Wi-Fi 6E AX411 card inside an extender host platform (WLAN setup) using a set of PIFA antennas. The card was operated utilizing proprietary software (DRTU version 99.2100.63.0-12409) and each channel was measured using a broadband power meter to determine the maximum average power.

As per the Interim Procedures for UNII 6-7GHz RF Exposure, explained in *RF Exposure Policies and Procedures: TCB Workshop – October 2020*, the testing has been performed on SAR following IEC/IEEE 62209-1528:2020 and then on Power Density for the highest SAR test configurations.

The testing has been performed on all positions (except back face) in both chains and the four considered bands. U-NII-5, U-NII-6, U-NII-7 and U-NII-8 in SAR mode. The back face position and the worst case configuration, identified during the SAR testing, were tested in Power Density mode .

Considering the antenna location diagrams in Annex G and the test exclusions described before, the surfaces/edges to be measured for each antenna are:

Antenna	Chain A	Chain B
Position	• Front face • Back Face • Top edge • Bottom edge • Left edge • Right edge	• Front face • Back Face • Top edge • Bottom edge • Left edge • Right edge

See *G.2 SAR/PD Test* positions section for more information on the tested positions

C.1.2 Test signal, Output power and Test Frequencies

For 802.11 transmission modes the device was put into operation by using an own control software to program the test mode required to select the continuous transmission with 100% duty cycle.

The output power of the device was set to transmit at maximum power for all tests.

C.3 Tissue Parameters Measurement

Head TSL

Freq. (MHz)	Target Parameters		Measured TSL Parameters		Deviation (%)		Date
	ε' (F/m)	σ (S/m)	ε' (F/m)	σ (S/m)	ε'	σ	
6500	34.46	6.07	33.17	5.99	3.74	1.32	2021-08-19
6500	34.46	6.07	32.76	6.11	4.93	0.65	2021-08-23

See *Annex E* for more details.

C.4 System Check Measurements

C.4.1 E-Field

Frequency	Signal Type	Target E-field (V/m)	Measured E-field (V/m)	Deviation (%)	Date
7.0 GHz	Continuous Wave	52.47	53.23	1.43	2021-08-27

The E-fields presented in the System Check Measurements table are Peak values. The target E-field value is obtained by simulation. The maximum target E-field value at 10 mm with 10 dBm (10 mW) source power is 52.47 V/m. The maximum measured E-field value at 10 mm with 10 dBm (10 mW) is 53.23 V/m.

C.4.2 H-Field

Frequency	Signal Type	Target H-field (A/m)	Measured H-field (A/m)	Deviation (%)	Date
7.0 GHz	Continuous Wave	0.14	0.14	0.00	2021-08-27

The H-fields presented in the System Check Measurements table are Peak values. The target H-field value is obtained by simulation. The maximum target H-field value at 10 mm with 10 dBm (10 mW) source power is 0.14 A/m. The maximum measured E-field value at 10 mm with 10 dBm (10 mW) is 0.14 A/m.

C.4.3 Local Power Density

Frequency	Signal Type	Target Local Power Density (W/m2)	Measured Local Power Density (W/m2)	Deviation (%)	Date
7.0 GHz	Continuous Wave	3.46	3.52	1.70	2021-08-27

The Local Power Density presented in the System Check Measurements table are Peak values. The target Local Power Density value is obtained by simulation. The maximum target Local Power Density value at 10 mm with 10 dBm (10 mW) source power is 3.46 W/m^2. The maximum measured E-field value at 10 mm with 10 dBm (10 mW) is 3.52 W/m^2.

C.4.4 Averaged Power Density

Frequency	Signal Type	Target Spatially Averaged Power Density (W/m2)	Measured Spatially Averaged Power Density (W/m2)	Deviation (%)	Date
7.0 GHz	Continuous Wave	3.31	3.28	0.91	2021-08-27

The Spatially Averaged Power Density presented in the System Check Measurements table are Peak values. The target Spatially Averaged Power Density value is obtained by simulation. The maximum target Spatially Averaged Power Density value at 10 mm with 10 dBm (10 mW) source power is 3.31 W/m^2. The maximum measured Spatially Averaged Power Density value at 10 mm with 10 dBm (10 mW) is 3.28 W/m^2.

See *Annex D* for more details.

C.4.5 SAR

Head Measurements

Frequency (MHz)	Average	Target SAR (W/Kg)	Measured SAR (W/Kg)	Deviation to target (%)	Limit (%)	Date
6500	1g	291.00	265.57	-8.74	±10	2021-08-20
	10g	53.80	49.84	-7.36		
6500	1g	291.00	269.61	-7.35		2021-08-23
	10g	53.80	50.65	-5.86		

C.5 Test Results

Ant.	Mode Data rate	BW (MHz)	Ch #	Freq (MHz)	Position	PStot avg [W/m²] 1cm²	PStot avg [W/m²] 4cm²	EM E [V/m]	EM H [A/m]	Plot #
Chain A	802.11ax HE0	160	207	6985	Front face	1.07	0.97	37.40	0.09	**8**
					Back Face	0.30	0.25	17.60	0.06	

C.5.6 Measurement Variability

According to FCC OET KDB 865664, SAR Measurement variability is assessed when the maximum initial measured SAR is >=0.8 W/kg for a certain band/mode.

As all measured values are under both limits, no variability is required

C.5.7 Simultaneous Transmission Evaluation – SAR

According to FCC OET KDB 447498 D01, when the sum of 1g SAR for all simultaneously transmitting antennas in an operating mode and exposure condition combination is within the SAR limit, SAR test exclusion applies to that simultaneous transmission configuration.

All the values stated in the table below are the worst case found for standalone measurement with disregard of the transmission mode or channel where the worst case was found

Antenna	Position	Highest Reported SAR (1g) (W/Kg)		
		WLAN 2.4GHz*	WLAN 6.5GHz	Bluetooth*
Chain A	Front face	0.24	0.29	0.01
Chain B	Front face	0.27	0.27	

* For Bluetooth and WLAN 2.4GHz values refer to test report 210611-03.TR07 - FCC-ISED_SAR Legacy,_AX411E2W

Position	Simultaneous Tx Antenna Combination		Σ SAR 1g (W/kg)	Limit (W/kg)
	Chain A	Chain B		
Front Face	WLAN 6GHz + BT	WLAN 6GHz	0.57	1.6
	WLAN 2.4GHz	WLAN 2.4GHz	0.47	
	BT	WLAN 2.4GHz	0.28	
	WLAN 2.4GHz	WLAN 6GHz + BT	0.47	
	WLAN 6GHz + BT	WLAN 2.4GHz	0.57	
	BT	WLAN 2.4GHz + 6GHz	0.55	
	-	WLAN 2.4GHz + 6GHz	0.54	
	WLAN 2.4GHz + 6GHz	-	0.53	
	WLAN 2.4GHz + 6GHz	WLAN 2.4GHz + 6GHz	1.07	

Considering the results described above and according to the simultaneous transmission SAR test exclusion considerations described in FCC OET KDB 447498 D01, no SAR to Peak Location Separation Ratio is required.

Annex D. Test System Plots

1. U-NII-5 - 802.11ax, CH47, Chain A – Front Face (SAR) 40
2. U-NII-6 - 802.11ax, CH111, Chain A – Front Face (SAR) 41
3. U-NII-7 - 802.11ax, CH143, Chain A – Front Face (SAR) 42
4. U-NII-8 - 802.11ax, CH207, Chain A – Front Face (SAR) 43
5. U-NII-5 - 802.11ax, CH79, Chain A – Front Face (PD) 44

5. U-NII-5 - 802.11ax, CH47, Chain A – Front Face (PD)

DUT: AX411E2W Module + PIFA Antenna; Type: WRF-BR-PIFA-V3.2;

Signal Source: modulation Custom Channel for 802.11ax, level 13.5 dBm.

Medium parameters used: σ = 0 S/m, ε_r = 1; ρ = 0 kg/m^3
Phantom section: Table Section
Measurement Standard: DASY6 (IEEE/IEC/ANSI C63.19-2011)

DASY Configuration:

- Probe: EUmmW - SN9366; ConvF(1, 1, 1); Calibrated: 2021-05-21;
  - Modulation Compensation:
- Sensor-Surface : 0mm (Fix Surface), z = 15 mm
- Electronics: DAE4 Sn1519; Calibrated: 2021-07-15
- Phantom: Cover; Type: SPEAG Phantom Cover;
- cDASY6 5G Module v2.2.0.76;
- Test Date: 2021-08-27

Distance-15mm/Measure PIFA Antenna (88.0x54.0):
Measurement Resolution = λ/4 mm
Measurement Scan area = 160 mm x 160 mm

The plots below show the average PStot (1cm^2), PStot (4cm^2) the E-field and the H Field

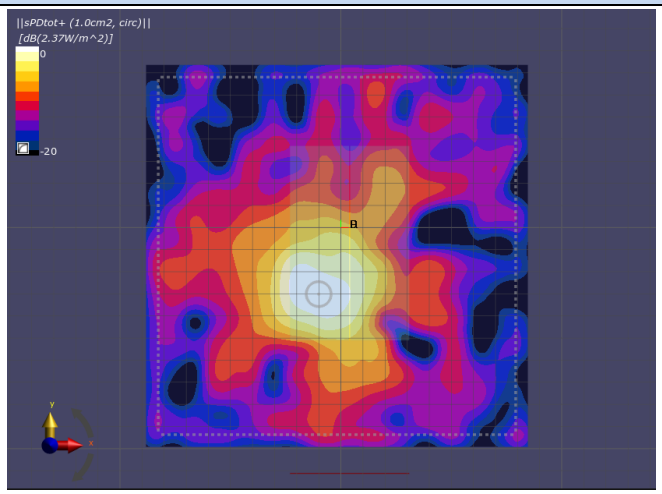
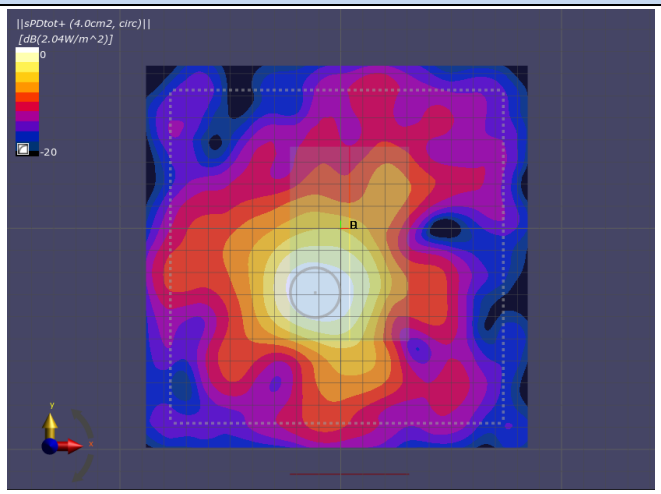
- cDASY6 5G Module v2.2.0.76;
- Test Date: 2021-08-27

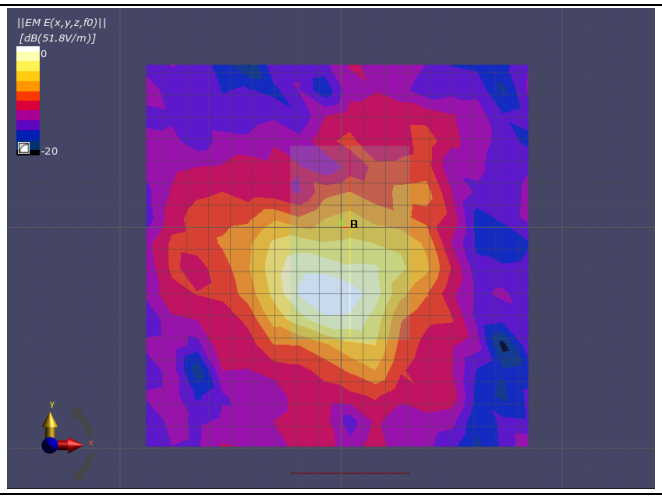
Distance-15mm/Measure PIFA Antenna (88.0x54.0):
Measurement Resolution = λ/4 mm
Measurement Scan area = 160 mm x 160 mm

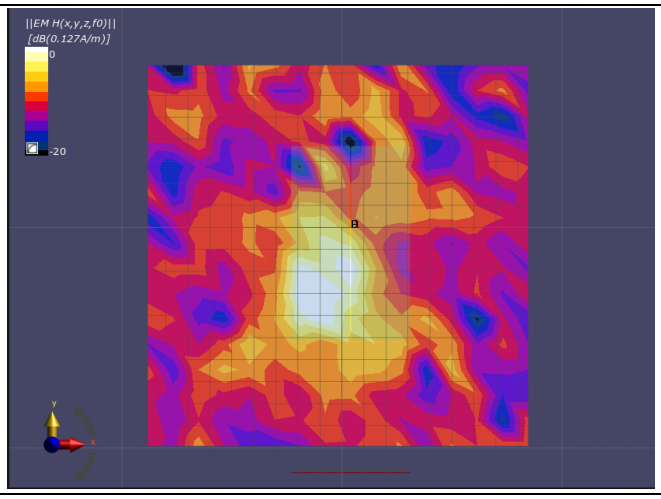
The plots below show the average PStot (1cm^2), PStot (4cm^2) the E-field and the H Field

Measurement Results









7. U-NII-7 - 802.11ax, CH143, Chain A – Front Face (PD)

DUT: AX411E2W Module + PIFA Antenna; Type: WRF-BR-PIFA-V3.2;

Signal Source: modulation Custom Channel for 802.11ax, level 13.5 dBm.

Medium parameters used: σ = 0 S/m, ε_r = 1; ρ = 0 kg/m^3
Phantom section: Table Section
Measurement Standard: DASY6 (IEEE/IEC/ANSI C63.19-2011)

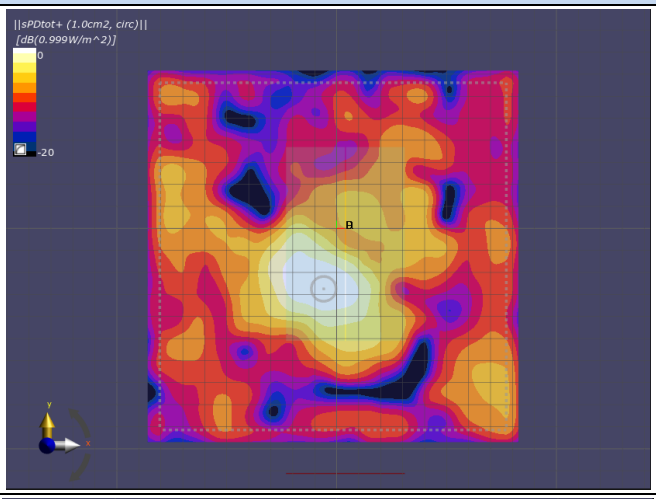
DASY Configuration:

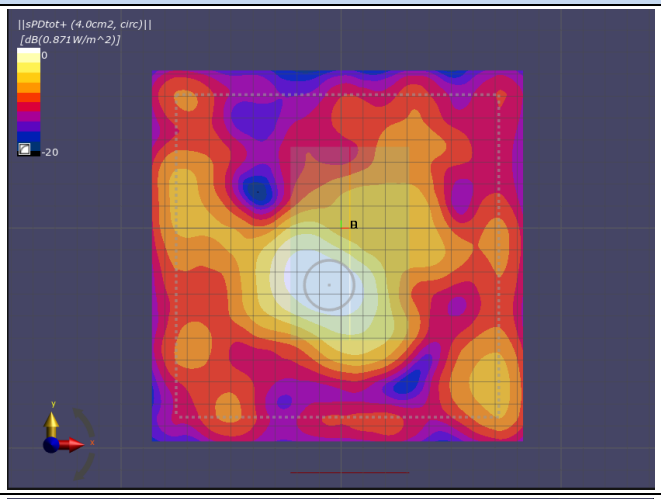
- Probe: EUmmW - SN9366; ConvF(1, 1, 1); Calibrated: 2021-05-21;
  - Modulation Compensation:
- Sensor-Surface : 0mm (Fix Surface), z = 15 mm
- Electronics: DAE4 Sn1519; Calibrated: 2021-07-15
- Phantom: Cover; Type: SPEAG Phantom Cover;
- cDASY6 5G Module v2.2.0.76;
- Test Date: 2021-08-27

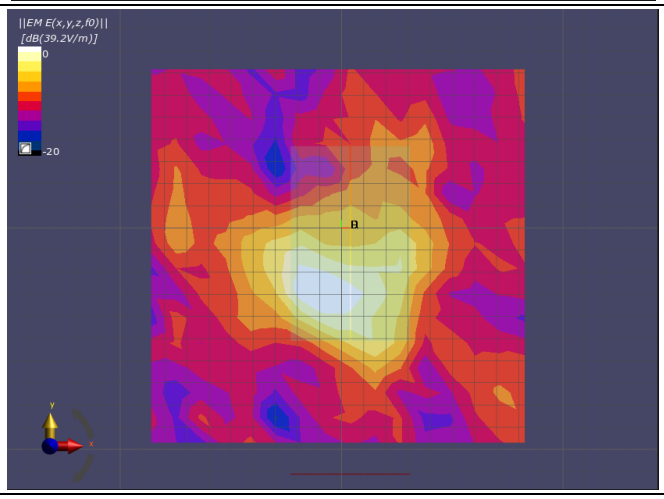
Distance-15mm/Measure PIFA Antenna (88.0x54.0):
Measurement Resolution = λ/4 mm
Measurement Scan area = 160 mm x 160 mm

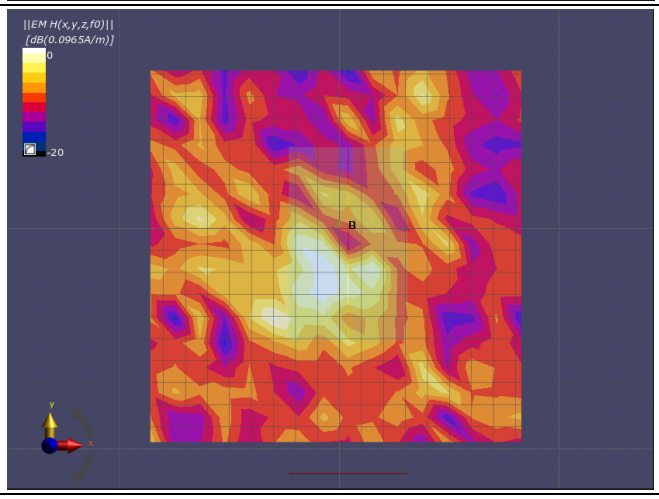
The plots below show the average PStot (1cm^2), PStot (4cm^2) the E-field and the H Field

Measurement Results









8. U-NII-8 - 802.11ax, CH207, Chain A – Front Face (PD)

DUT: AX411E2W Module + PIFA Antenna; Type: WRF-BR-PIFA-V3.2;

Signal Source: modulation Custom Channel for 802.11ax, level 13.0 dBm.

Medium parameters used: σ = 0 S/m, ε_r = 1; ρ = 0 kg/m^3
Phantom section: Table Section
Measurement Standard: DASY6 (IEEE/IEC/ANSI C63.19-2011)

DASY Configuration:

- Probe: EUmmW - SN9366; ConvF(1, 1, 1); Calibrated: 2021-05-21;
  - Modulation Compensation:
- Sensor-Surface : 0mm (Fix Surface), z = 15 mm
- Electronics: DAE4 Sn1519; Calibrated: 2021-07-15

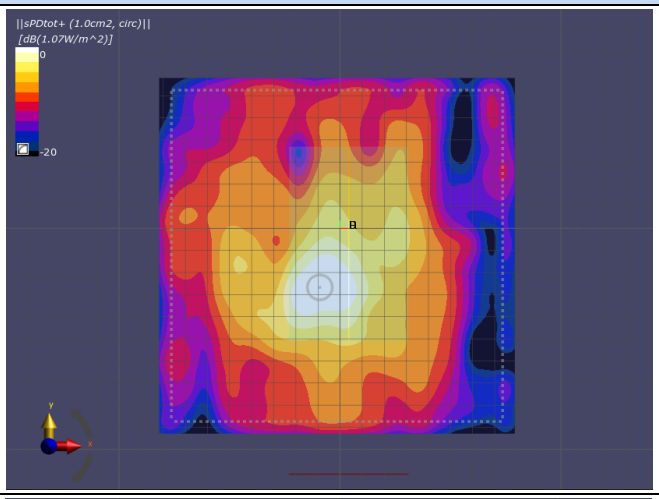
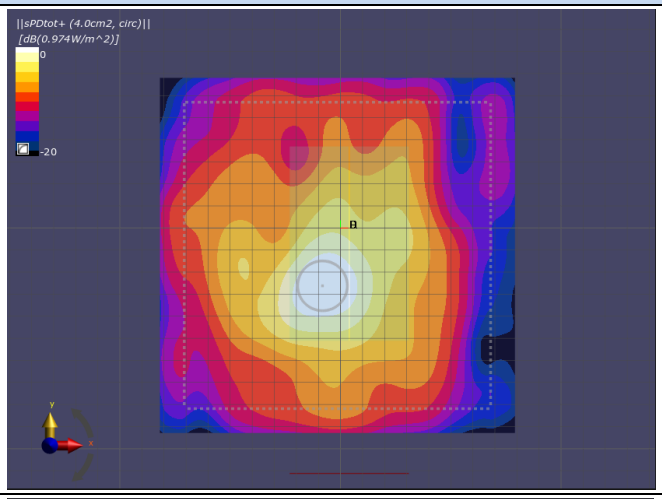
- cDASY6 5G Module v2.2.0.76;
- Test Date: 2021-08-27

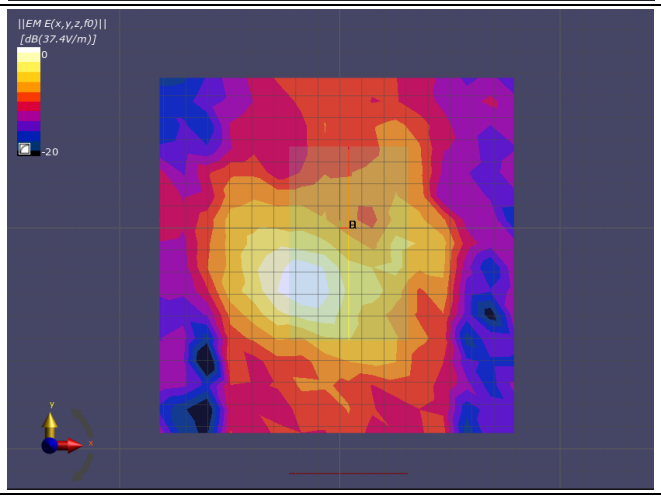
Distance-15mm/Measure PIFA Antenna (88.0x54.0):
Measurement Resolution = λ/4 mm
Measurement Scan area = 160 mm x 160 mm

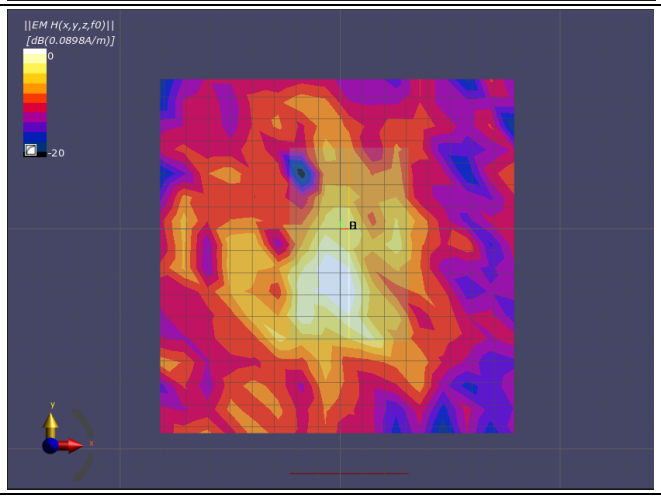
The plots below show the average PStot (1cm^2), PStot (4cm^2) the E-field and the H Field

Measurement Results









9. Power Density System Check From 7000MHz

DUT: Horn reference source; Type: PE9859/SF-15;

Signal Source: modulation CW, level 10 dBm.

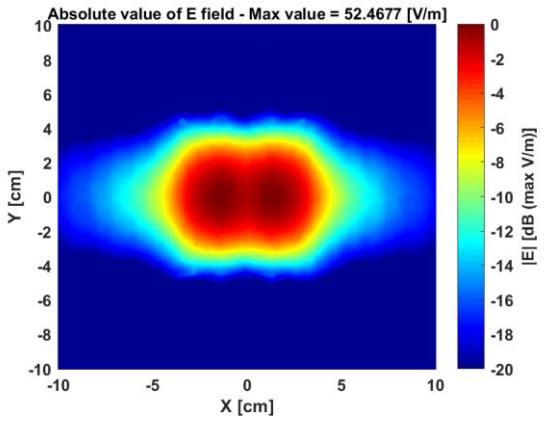
Medium parameters used: σ = 0 S/m, ε_r = 1; ρ = 0 kg/m^3
Phantom section: Table Section
Measurement Standard: DASY6 (IEEE/IEC/ANSI C63.19-2011)

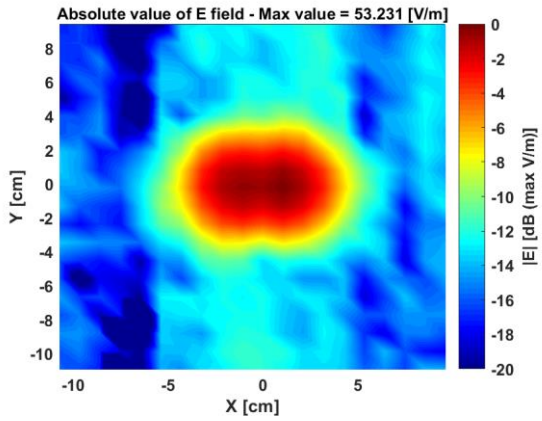
DASY Configuration:

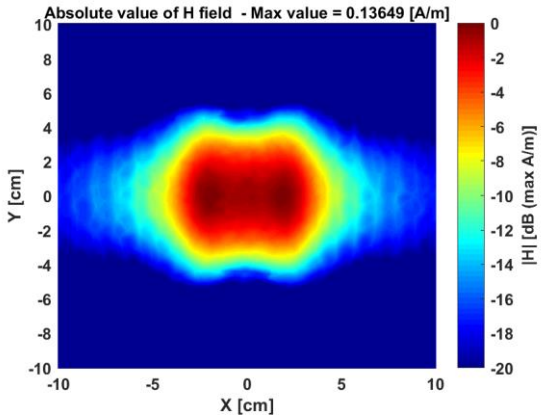
- Probe: EUmmW - SN9366; ConvF(1, 1, 1); Calibrated: 2021-05-21;
    - Modulation Compensation:
- Sensor-Surface : 0mm (Fix Surface), z = 10 mm
- Electronics: DAE4 Sn1519; Calibrated: 2021-07-15
- Phantom: Cover; Type: SPEAG Phantom Cover;
- cDASY6 5G Module v2.2.0.76;
- Test Date: 2021-08-27

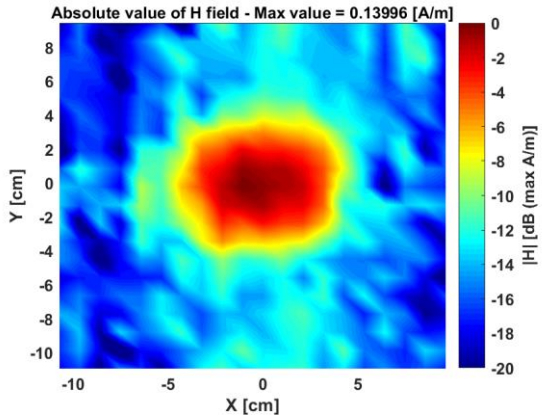
Distance-10mm/Measure Horn reference source (86.9x63.5):
Measurement Resolution = λ/4 mm
Measurement Scan area = 200 mm x 200 mm

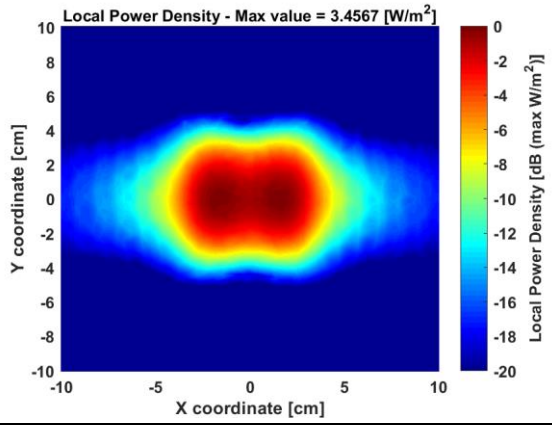
The plots below show the comparison between the Numerical Modeling results and the system check measurement results in terms of E-field, H Field, single point power density and Avg Power density 1cm^2.

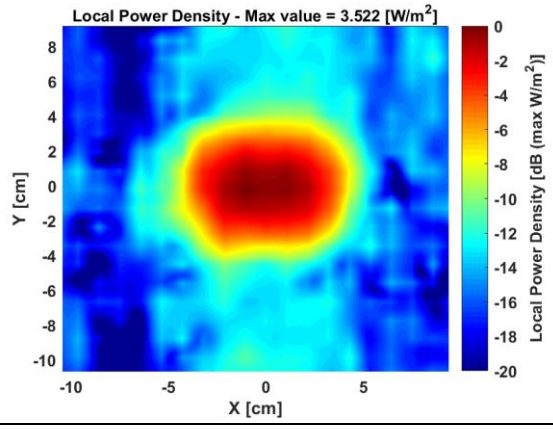
Numerical Modeling Results	Measurement Results
				


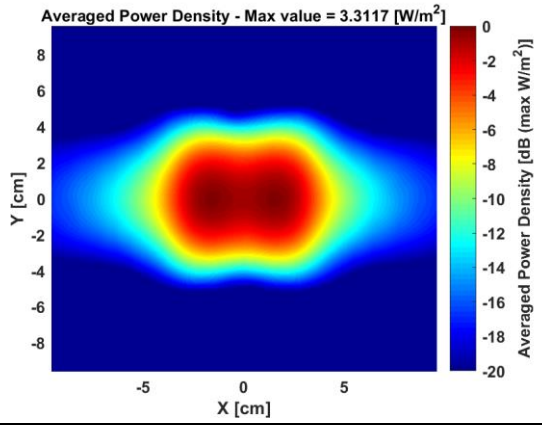


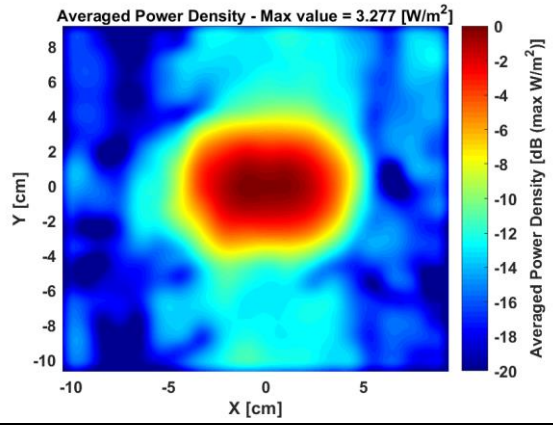




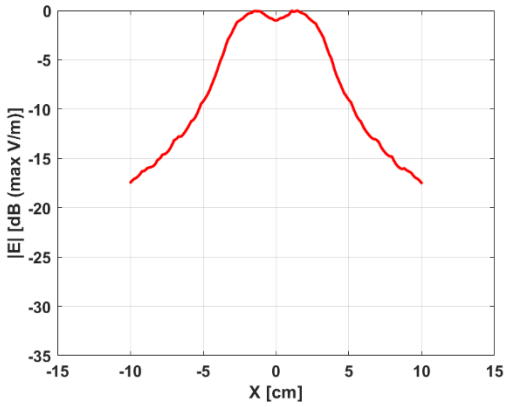


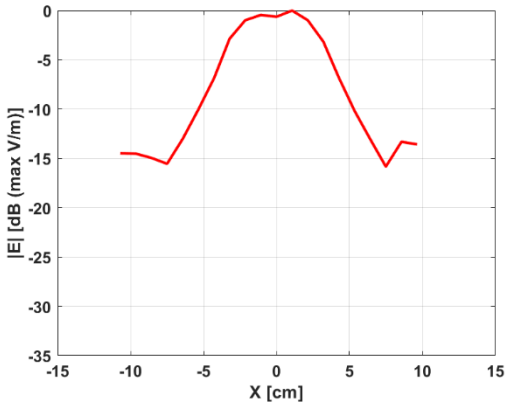






The plots below show the comparison between the numerical modeling and the system check results in terms of normalized E-field distribution and the 1D variation along the two axis of the maximum.

- **Numerical Modeling Results** - scan area: 200 mm x 200 mm - Resolution: 0.5 mm	**System Check Measurement Results** - scan area: 200 mm x 200 mm - Resolution: λ/4 mm
	Field variation through the maximum along the E-field polarization	
	Field variation through the maximum along the H-field polarization	
	




10. SAR System Check From 6500MHz – 2021-08-19

Device under Test Properties

Name, Manufacturer	Dimensions [mm]	IMEI	DUT Type
D6.5GHzV2, SPEAG	50.0 x 10.0 x 8.0	1013	Validation Dipole

Exposure Conditions

Phantom Section, TSL	Position, Test Distance [mm]	Band	Group, UID	Frequency [MHz], Channel Number	Conversion Factor	TSL Conductivity [S/m]	TSL Permittivity
Flat, HSL	,		, 0--	6500.0, 0	5.2	5.99	33.2

Hardware Setup

Phantom	TSL, Measured Date	Probe, Calibration Date	DAE, Calibration Date
