TEST RESULT CERTIFICATION

Applicant's name : Adapt Ideations Private Limited

Address : SY No 8 9,1/89/G/36,Shilpi Valley,Gafoor Nagar,Madhavapur
Village,Ranga Reddy

Manufacture's name : Adapt Ideations Private Limited

Address : SY No 8 9,1/89/G/36,Shilpi Valley,Gafoor Nagar,Madhavapur
Village,Ranga Reddy

Product name : Temperature Data logger

Model name : KARTO G200,PIXEL C100,PIXEL C300,PIXEL W100,
PIXEL W300

Standards : FCC Part 22 Subpart H

Test procedure : FCC Part 2
ANSI/TIA-603-E-2016 ANSI C63.26:2015
KDB 971168 D01 Power Meas License Digital Systems v03r01

Test Date : Sept. 05, 2023 to Oct. 19, 2023

Date of Issue : Nov. 03, 2023

Test Result : Pass

This device described above has been tested by PTC, and the test results show that the equipment under test (EUT) is in compliance with the FCC requirements. And it is applicable only to the tested sample identified in the report.

This report shall not be reproduced except in full, without the written approval of PTC, this document may be altered or revised by PTC, personal only, and shall be noted in the revision of the document.

1 General description

1.1 Feature of equipment under test (EUT)

Product name:	Temperature Data logger
Model name:	KARTO G200,PIXEL C100,PIXEL C300,PIXEL W100, PIXEL W300
Difference in series models:	All the model are the same circuit and RF module, except the model No. and color.
Frequency range:	GSM850: TX824.2MHz~848.8MHz RX869.2MHz~893.8MHz;
Modulation type:	GMSK for GPRS; 8PSK for EGPRS
Power class:	Multi-Class12 Only 4 timeslots are used for GPRS
SIM card:	1 SIM Card socket
Antenna Type	PCB Antenna
Antenna gain:	2.3dBi
Battery:	Lion battery DC3.7V 8700mAh
Hardware version	Pixel_Gen_3
Software version	Pixel V1.1.0

1.2 Test frequency channel

Frequency Band	Frequency	Channel	Frequency(MHz)
GSM 850	Low	128	824.2
	Middle	190	836.6
	High	251	848.8

1.3 EUT operation mode

During testing, RF test program provided by the manufacture to control the Tx operation followed the test requirement. The EUT is configured to transmit continuously (duty cycle > 98 %) at the maximum power control level.

1.4 Test conditions

During the measurement the environmental conditions were within the listed ranges:

- Temperature: 15°C~35°C
- Humidity: 20%~75%
- Atmospheric pressure: 98kPa~101kPa

1.5 Ancillary equipment list

Equipment	Model	S/N
Adapter	XSC-0502000SU Input:100-240V~, 0.4A, 50-60Hz Output : DC 5V, 2A	/

2 Summary of Test Result

Item	FCC Part No.	Description of Test	Result
1	2.1046, 22.913(a);	Maximum output power	Pass
2	2.1046, 22.913(d);	Peak to average power ratio(PAPR)	Pass
3	2.1046, 22.913(a);	Transmitter Radiated Power (EIRP/ERP)	Pass
4	2.1049; 22.917(b);	Occupied Bandwidth	Pass
5	2.1051; 22.917(a);	Conducted spurious emissions	Pass
6	2.1051; 22.917(b);	Spurious emissions at band edge	Pass
7	2.1053; 22.917(a);	Radiated spurious emissions	Pass
8	2.1055; 22.355;	Frequency Stability	Pass

3 Test facilities and accreditations

3.1 Test laboratory

Precise Testing & Certification Co., Ltd

Address: Building 1, No. 6, Tongxin Road, Dongcheng Street, Dongguan, Guangdong, China

FCC Registration Number: 790290

A2LA Certificate No.: 4408.01

IC Registration Number: 12191A

CAB identifier: CN0080

3.2 Environmental conditions

Temperature:	15°C~35°C
Humidity	20%~75%
Atmospheric pressure	98kPa~101kPa

3.3 Measurement uncertainty

Parameter	Uncertainty
RF output power, conducted	±1.0dB
Power Spectral Density, conducted	±2.2dB
Radio Frequency	± 1 x 10 ⁻⁶
Bandwidth	± 1.5 x 10 ⁻⁶
Time	±2%
Duty Cycle	±2%
Temperature	±1°C
Humidity	±5%
DC and low frequency voltages	±3%
Conducted Emissions (150kHz~30MHz)	±3.64dB
Radiated Emission(9kHz ~30MHz)	±3.15dB
Radiated Emission(30MHz~1GHz)	±5.03dB
Radiated Emission(1GHz~25GHz)	±4.74dB

3.4 Test software

Software Name	Manufacturer	Model	Version
GSM	Shenzhen JS tonscend co., ltd	JS1120-4	2.1.6

Remark: The temporary antenna connector is soldered on the PCB board in order to perform conducted tests and this temporary antenna connector is listed in the equipment list.

5 Test Result

5.1 Maximum output power and EIRP & ERP

5.1.1 Limit

For FCC 22.913: The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts.

5.1.2 Test method

For Conducted output power:

1. Use a universal radio communication tester, the output power of EUT was measured at the antenna terminal. The path loss was calibrated and entered as an offset into the test equipment.
2. The EUT was configured to transmit on maximum power by the radio communication tester.
3. Measured the peak and average powers.

For EIRP & ERP:

1. In many cases, the RF output power limits for licensed digital transmission devices is specified in terms of effective radiated power (ERP) or equivalent isotropic radiated power (EIRP). Typically, ERP is specified when the operating frequency is less than or equal to 1 GHz and EIRP is specified when the operating frequency is greater than 1 GHz. Both are determined by adding the transmit antenna gain to the conducted RF output power with the primary difference between the two being that when determining the ERP, the transmit antenna gain is referenced to a dipole antenna (i.e., dBd) whereas when determining the EIRP, the transmit antenna gain is referenced to an isotropic antenna (dBi).

2. The relevant equation for determining the ERP or EIRP from the conducted RF output power measured using the guidance provided above is:

$$\text{ERP/EIRP} = P_{\text{Meas}} + \text{GT} - \text{LC}$$

where:

ERP/EIRP = effective or equivalent radiated power, respectively (expressed in the same units as P_{Meas} , typically dBW or dBm);

P_{Meas} = measured transmitter output power or PSD, in dBm or dBW;

GT = gain of the transmitting antenna, in dBd (ERP) or dBi (EIRP);

dBd (ERP)=dBi (EIRP) -2.15 dB

LC = signal attenuation in the connecting cable between the transmitter and antenna, in dB.

For devices utilizing multiple antennas, KDB 662911 provides guidance for determining the effective array transmit antenna gain term to be used in the above equation.

**5.1.3 Test Result**For Conducted output power:

Band	Channel	Slot	Power(dBm)	Limit(dBm)	Verdict

848.8	V	23.66	0.32	3	2.15	24.19	0.2624

For EGPRS 850

Frequency	Polarization	SG Level	Cable Loss	Antenna Gain	Correction	ERP	ERP
(MHz)		(dBm)	(dB)	(dB)	(dB)	(dBm)	(W)
824.2	H	18.96	0.39	3	2.15	19.42	0.0875
836.6	H	18.52	0.35	3	2.15	19.02	0.0798
848.8	H	19.19	0.32	3	2.15	19.72	0.0938
824.2	V	18.62	0.39	3	2.15	19.12	0.0817
836.6	V	18.89	0.35	3	2.15	19.39	0.0869
848.8	V	18.82	0.32	3	2.15	18.35	0.0684

Note: ERP = SG Level- Cable Loss + Antenna Gain – Correction

EIRP= SG Level- Cable Loss + Antenna Gain

5.2 Peak to average power ratio (PAPR)

5.2.1 Limit

The peak-to-average power ratio (PAPR) of the transmitter output power must not exceed 13 dB. The PAPR measurements should be made using either an instrument with complementary cumulative distribution function (CCDF) capabilities to determine that PAPR will not exceed 13 dB for more than 0.1 percent of the time or other Commission approved procedure. The measurement must be performed using a signal corresponding to the highest PAPR expected during periods of continuous transmission.

5.2.2 Test method

The EUT was connected to Spectrum Analyzer and Base Station via power divider.

The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement.

Set the number of counts to a value that stabilizes the measured CCDF curve.

Set the measurement interval to 1 ms.

Record the maximum PAPR level associated with a probability of 0.1%.

a) Refer to instrument's analyzer instruction manual for details on how to use the power statistics/CCDF function;

b) Set resolution/measurement bandwidth $\geq$ signal's occupied bandwidth;

c) Set the number of counts to a value that stabilizes the measured CCDF curve;

d) Set the measurement interval as follows:

1) for continuous transmissions, set to 1 ms,

2) for burst transmissions, employ an external trigger that is synchronized with the EUT burst timing sequence, or use the internal burst trigger with a trigger level that allows the burst to stabilize and set the measurement interval to a time that is less than or equal to the burst duration.

e) Record the maximum PAPR level associated with a probability of 0.1%.

5.2.3 Test Result

Band	Channel	Result(dB)	Limit(dB)	Verdict
GPRS850	128	2.6	13	PASS
GPRS850	190	2.61	13	PASS
GPRS850	251	2.6	13	PASS
EGPRS850	128	5.65	13	PASS
EGPRS850	190	5.65	13	PASS
EGPRS850	251	5.66	13	PASS

Note: all modes of EUT have been tested; only the data of worst case mode is report.

5.3 Occupied bandwidth

5.3.1 Test method

1. The EUT was directly connected to the spectrum analyzer and Base station via power splitter as show in the block diagram above.
2. The resolution bandwidth of the Spectrum Analyzer is set to at least 1% of the occupied bandwidth.
3. The low, middle and the high channels are selected to perform tests respectively.
4. Set the frequency range of the Spectrum Analyzer suitably to capture the waveform; search peak; make a line whose value is 26dB lower than the peak; mark two points which the line intersected the waveform at; finally record the delta of the two points as the occupied bandwidth and the plot.
5. Set the Spectrum Analyzer Occupied bandwidth function to measure the 99% occupied bandwidth.

5.3.2 Test result

Band	Channel	Occupied Bandwidth (MHz)	26dB Bandwidth (MHz)	Limit (MHz)	Verdict
GPRS850	128	0.24683	0.3123	---	PASS

5.4 Conducted spurious emissions

5.4.1 Limits

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43+10\log(P)$ dB

5.4.2 Test method

1, The EUT was directly connected to the spectrum analyzer and Base station via power splitter as show in the block diagram above.

2, Spectrum Setting:

Frequency bellow 1 GHz: RBW=100 kHz, VBW=300 kHz.

Frequency above 1 GHz: RBW=1 MHz, VBW=3 MHz.

3, The low, middle and high channels of each band and mode's spurious emissions for 30 MHz to 10th Harmonic were measured by Spectrum analyzer.

5.4.3 Test result

Band	Channel	Frequency Range(MHz)	Max.Freq. (MHz)	Result (dBm)	Limit (dBm)	Verdict
GPRS850	128	0.009~0.15MHz	0.01	-62.2	-33	PASS

EGPRS850	251	1000~10000MHz	3187	-48.87	-13	PASS

Note: all modes of EUT have been tested; only the data of worst case mode is reported

5.5 Band edge

5.5.1 Limits

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43+10\log(P)$ dB, for all power levels +30 dBm to 0 dBm, this becomes a constant specification limit of -13 dBm

5.5.2 Test method

The testing follows FCC KDB 971168 D01v03r01 Section 6.0.

The EUT was connected to Spectrum Analyzer and Base Station via power divider.

The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator.

The path loss was compensated to the results for each measurement.

The band edges of low and high channels for the highest RF powers were measured.

The RF fundamental frequency should be excluded against the limit line in the operating frequency band.

The limit line is derived from $43 + 10\log(P)$ dB below the transmitter power P(Watts)

$= P(W) - [43 + 10\log(P)]$ (dB)

$= [30 + 10\log(P)]$ (dBm) - $[43 + 10\log(P)]$ (dB)

$= -13\text{dBm}$.

5.5.3 Test result

Band	Channel	Freq (MHz)	Result (dBm)	Limit(dBm)	Verdict
GPRS850	128	823.98	-16.18	-13	PASS
GPRS850	251	849.01	-15.13	-13	PASS
EGPRS850	128	823.99	-22.88	-13	PASS
EGPRS850	251	849.03	-24.53	-13	PASS

GPRS850-128

GPRS850-251

EGPRS850-128

Note: all modes of EUT have been tested; only the data of worst case mode is reported

5.6 Radiated spurious emission

5.6.1 Limit

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43+10\log(P)$ dB

5.6.2 Test method

1. The test system setup as show in the block diagram above.
2. The EUT was placed on an non-conductive rotating platform in an anechoic chamber. The radiated spurious emissions from 30MHz to 10th harmonious of fundamental frequency were measured at 3 m with a test antenna and a spectrum analyzer with RBW=1 MHz, VBW=1 MHz, peak detector settings.
3. During the measurement, the EUT was enforced in maximum power and linked with a base station. All the spurious emissions at 3m were measured by rotation of the turntable and the test antenna raised and lowered over a range from 1 to 4 meters in both horizontally and vertically polarized orientations.
4. When found the maximum level of emissions from the EUT. Remove the EUT and replace it with substitution antenna. A signal generator was connected to the substitution antenna by a non-radiating cable. The absolute levels of the spurious emissions were measured by the substitution.

Spurious emissions in dB= $10 \log(\text{TX power in Watts}/0.001)$ -the absolute level

Spurious attenuation limit in dB= $43+10 \log(\text{power out in Watts})$.

5.6.3 Test setup

Radiated emission test-up frequency below 30MHz

Radiated emission test-up frequency above 1GHz

5.6.4 Test Result

Note: All the configuration was tested and only the worse case was reported

GPRS850_ Low Channel								
Frequency	SG Level	Cable Loss	Diatance	Antenna Gain	Absolute Level	Limit	Margin	Polarization

5.7 Frequency stability

5.7.1 Limit

For FCC part 22.355: the carrier frequency of each transmitter in the Public Mobile Services must be maintained within the tolerances 2.5ppm for mobile $\leq 3W$ condition.

For FCC part 24.235: The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

5.7.2 Test method

Test Procedures for Temperature Variation:

- 1, The EUT was set up in the thermal chamber and connected with the base station.
- 2, With power off, the temperature was decreased to -30°C and the EUT was stabilized for three hours. Power was applied and the maximum change in frequency was recorded within one minute.
- 3, With power off, the temperature was raised in 10°C set up to 50°C and the EUT was stabilized for three hours. Power was applied and the maximum change in frequency was recorded within one minute.
- 4, measure the carrier frequency error.

Test Procedures for Voltage Variation:

- 1, The EUT was placed in a temperature chamber at $25\pm 5^{\circ}\text{C}$ and connected with the base station.
- 2, Reduce the primary supply voltage to the battery operating end point.
- 3, measure the carrier frequency error.

5.7.3 Test Result

Note:

1. Normal Voltage = 3.7V; Minimun (BEP) = 3.33V; Maximum Voltage =4.07V
2. All modes of EUT have been tested; only the data of worst case mode is reported.

6 Photographs of the Test Setup

Radiated emission

Report No.: PTC2307170220201E-FC02

7 Photographs of the EUT

Please reference the “ EUT PHOTO” .
