1 Assessment

The following device was evaluated against the applicable criteria specified in FCC rules Parts 15.255 of Title 47 of the Code of Federal Regulations and the relevant ISED Canada standard RSS-210.

No deviations were ascertained.

Company	Description	Model #
Praesidium Inc.	Contactless vital sign detection sensor	2002BIO1

Responsible for Testing Laboratory:

2023-04-12	Compliance	Arndt Stoecker (EMC Lab Manager)	
Date	Section	Name	Signature

Responsible for the Report:

2023-04-12	Compliance	Issa Ghanma (Deputy Lab Manager)	
Date	Section	Name	Signature

The test results of this test report relate exclusively to the test item specified in Section 3.

CETECOM Inc. USA does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item. The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of CETECOM Inc. USA.

2 Administrative Data

2.1 Identification of the Testing Laboratory Issuing the EMC Test Report

Company Name:	CETECOM Inc.
Department:	Compliance
Street Address:	411 Dixon Landing Road
City/Zip Code	Milpitas, CA 95035
Country	USA
Telephone:	+1 (408) 586 6200
Fax:	+1 (408) 586 6299
EMC Lab Manager:	Arndt Stoecker
Responsible Project Leader:	Rami Saman

2.2 Identification of the Client

Client's Name:	Praesidium Inc.
Street Address:	150 N 200 E
City/Zip Code	St. George Utah 84770
Country	USA

2.3 Identification of the Manufacturer

Manufacturer's Name:	Same as Client
Manufacturers Address:	Same as Client
City/Zip Code	-----
Country	-----

3 Equipment Under Test (EUT)

3.1 EUT Specifications

Model No:	2002BIO1
HW Version :	2002BIO1
SW Version :	V1.0.0
FCC-ID :	2A7ZX2002BIO1
IC-ID:	28837-2002BIO1
FWIN:	N/A
HVIN:	2002BIO1
PMN:	RemWave Sleep
Product Description:	Contactless vital sign detection sensor
Frequency Range / number of channels:	WiFi : 2400 MHz – 2483.5 MHz; Center to center: 2412 MHz (ch 1) – 2462 MHz (ch 11), 11 channels Radar: 60-64 GHz
Radio Information:	<u>WLAN (WiFi Pre-certified)</u> WIZnet H.K. LTD. Model: WIZFI360PA FCC ID: 2ATUB-WIZFI360PA ISED: 20560-WIZFI360PA <u>Radar IWR6843 Chip</u>
Modes of Operation:	1: normal operation mode (FMCW ca.1% duty cycle) 2: continuous transmission mode (FMCW ca. 100% duty cycle) 3: continuous wave transmission mode (CW)
Antenna Information as declared:	<u>Main Antenna:</u> PCB embedded 2.4 GHz Wi-Fi antenna gain 2 dBi gain PCB embedded 60-64 GHz Radar antenna, 15 dBi gain
Power Supply/ Rated Operating Voltage Range:	Vmin: 4.25 VDC/ Vnom: 5V VDC / Vmax: 5.75 VDC 5V 1A (5W) DC, USB-C input
Operating Temperature Range	32° to 104°F (0° to 40°C)
Other Radios included in the device:	-
Sample Revision	☐ Prototype Unit; ☐ Production Unit; ☒ Pre-Production
EUT Dimensions	H x W x D (1.64in) x (4.25in) x (4.25in)

3.2 EUT Sample details

EUT #	Serial Number	HW Version	SW Version	Notes/Comments
1	-----	2002BIO1	V1.0.0	-----

3.3 Accessory Equipment (AE) details

AE #	Type	Model	Manufacturer	Serial Number
1	ACDC Charger	XSD-0501000NUSD	Shenzhen Sunshine Technological Co., Ltd.	-----

3.4 Test Sample Configuration

EUT Set-up #	Combination of AE used for test set up	Comments
1	EUT#1 + AE#1	The radio of the EUT is configured according to requirement of each test case

3.5 Justification for Worst Case Mode of Operation

During the testing process, the EUT was tested with transmitter sets on low, mid and high channels, and continuous wave transmission.

For radiated measurements, all data in this report shows the worst case between horizontal and vertical antenna polarizations and for all orientations of the EUT.

4 Subject of Investigation

The objective of the measurements done by CETECOM Inc. was to assess the performance of the EUT according to the relevant requirements specified in FCC rules Part 15.255 of Title 47 of the Code of Federal Regulations and Radio Standard Specification RSS-210 Issue 10 of ISED Canada.

This test report is to support a request for new equipment authorization under the:

- FCC ID: 2A7ZX2002BIO1
- IC ID: 28837-2002BIO1

Testing procedures are based on ANSI C63.10:2013 including chapter 9 for millimeter-wave systems.

5 Measurement Results Summary

Test Specification	Test Case	Temperature and Voltage Conditions	Mode	Pass	NA	NP	Result
§15.255(c)(3) RSS-210 J.2.1 (b)	Equivalent Isotropic Radiated Power and Conducted Output Power	Nominal	2	■	□	□	Complies
§15.255(e) RSS-210 J.4 (c)	6 dB Occupied Bandwidth	Nominal	2	■	□	□	Complies
RSS-Gen 6.7	99% Occupied Bandwidth	Nominal	2	□	■	□	For info only
§15.255(f) RSS-210 J.6	Frequency Stability	Nominal and extreme	2	■	□	□	Complies Note1
§15.255(h) RSS-210 J.7	Group Installation	Nominal	-	□	■ *	□	Complies
§15.255(d) §15.209 (a) RSS-210 J.3	TX Spurious emissions-Radiated	Nominal	3	■	□	□	Complies
§15.207 RSS-Gen 8.8	AC Conducted Emissions	Nominal	2	■	□	□	Complies

Note: NA= Not Applicable; NP= Not Performed.

Note 1: test was performed from 0°C to 40°C as specified in the user manual. This device is for indoor use only.

*): see manufacturer's product manual.

6 **Measurements**

6.1 **Measurement Uncertainty**

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus, with 95% confidence interval (in dB delta to result), based on a coverage factor k=2.

Radiated measurement

9 kHz to 30MHz	±2.5 dB (Magnetic Loop Antenna)
30 MHz to 1000 MHz	±2.0 dB (Biconilog Antenna)
1 GHz to 40 GHz	±2.3 dB (Horn Antenna)
40-60 GHz	±3.95 dB (Horn Antenna)
60-90 GHz	±3.32 dB (External Mixer, Horn Antenna)
90-140 GHz	±4.94 dB (External Mixer, Horn Antenna)
140-225 GHz	±5.42 dB (External Mixer, Horn Antenna)

Conducted measurement

RF conducted measurement	±0.5 dB
--------------------------	---------

6.2 **Environmental Conditions During Testing:**

The following environmental conditions were maintained during the course of testing:

- Ambient Temperature: 20-25 °C
- Relative humidity: 40-60%

6.3 **Dates of Testing:**

2023-02-08 to 2023-03-28

7 Measurement Procedures

7.1 Radiated Measurement

The radiated measurement is performed according to: ANSI C63.10 (2013)

- The exploratory measurement is accomplished by running a matrix of 16 sweeps over the required frequency range with R&S Test-SW EMC32 for 4 positions of the turntable, two orthogonal positions of the EUT and both antenna polarizations. This procedure exceeds the requirement of the above standards to cover the 3 orthogonal axis of the EUT. A max peak detector is utilized during the exploratory measurement. The Test-SW creates an overall maximum trace for all 12 sweeps and saves the settings for each point of this trace. The maximum trace is part of the test report.
- The 10 highest emissions are selected with an automatic algorithm of EMC32 searching for peaks in the noise floor and ensuring that broadband signals are not selected multiple times.
- The maxima are then put through the final measurement and again maximized in a 90deg range of the turntable, fine search in frequency domain and height scan between 1m and 4m.
- The above procedure is repeated for all possible ways of power supply to EUT and for all supported modulations.
- In case there are no emissions above noise floor level only the maximum trace is reported as described above.
- The results are split up into up to 4 frequency ranges due to antenna bandwidth restrictions. A magnetic loop is used from 9 kHz to 30 MHz, a Biconilog antenna is used from 30 MHz to 1 GHz, and two different horn antennas are used to cover frequencies up to 40 GHz.

Radiated Emissions Test Setup 30MHz-1GHz Measurements

Radiated Emissions Test Setup above 1GHz Measurements

7.1.1 Sample Calculations for Field Strength Measurements

Field Strength is calculated from the Spectrum Analyzer/ Receiver readings, taking into account the following parameters:

1. Measured reading in dB μ V
2. Cable Loss between the receiving antenna and SA in dB and
3. Antenna Factor in dB/m

All radiated measurement plots in this report are taken from a test SW that calculates the Field Strength based on the following equation:

$$FS \text{ (dB}\mu\text{V/m)} = \text{Measured Value on SA (dB}\mu\text{V)} + \text{Cable Loss (dB)} + \text{Antenna Factor (dB/m)}$$

Example:

Frequency (MHz)	Measured SA (dB μ V)	Cable Loss (dB)	Antenna Factor Correction (dB/m)	Field Strength Result (dB μ V/m)
1000	80.5	3.5	14	98.0

7.2 Power Line Conducted Measurement Procedure

AC Power Line conducted emissions measurements performed according to: ANSI C63.4 (2014)

8 Test Result Data

8.1 EIRP and Maximum Peak Conducted Output Power

8.1.1 Measurement according to ANSI C63.10 Section 9.11

1. An RF detector with a bandwidth encompassing the entire authorized frequency band is used. An appropriate test horn antenna is connected to it and put in the main beam of the EUT. The video output of the RF detector is feed to a DSO.
2. The EUT is set to transmission with max. power level. Frequent sweeps have been done on the DSO to capture the highest level of the video output.

Fig. 1: Test setup 1. $\text{EIRP}_{\text{EUT}} - \text{FSL}_1 + \text{AG}_{\text{meas}} = P_{\text{detector}}$

3. Replace the EUT with a setup generating unmodulated mm-wave at the center frequency of the EUT frequency range. The setup includes a signal generator, a frequency multiplier, a variable attenuator and a horn antenna.
4. Adjust the level of the generated mm-wave till the DSO shows the same voltage level as the highest level captured measuring the EUT.

Fig. 2: Test setup 2. $P_{\text{SG}} + \text{AG}_{\text{TX}} - \text{FSL}_2 + \text{AG}_{\text{meas}} = P_{\text{detector}}$

5. Without making any other change, disconnect the transmitting antenna on this signal generating setup and measure the output level of the setup with a wideband mm-wave power meter with a thermocouple detector in the conducted way.

Fig. 3: Test setup 3. $P_{\text{SG}} = P_{\text{sensor}}$

6. Applying the equations in ANCI C63.10 to calculate the EIRP and conducted output of the EUT

8.1.2 Limits:

Maximum Peak Output Power:

FCC §15.255 (c):

- (3) For fixed field disturbance sensors other than those operating under the provisions of paragraph (c)(2) of this section, and short-range devices for interactive motion sensing, the peak transmitter conducted output power shall not exceed -10 dBm and the peak EIRP level shall not exceed 10 dBm.

IC RSS-210 J.2.1:

- (b) For fixed field disturbance sensors other than those operating under the provisions of (a) above and for interactive motion sensors, the peak transmitter output power shall not exceed -10 dBm, and the peak e.i.r.p. shall not exceed 10 dBm.

8.1.3 Test conditions and setup:

Ambient Temperature	EUT Set-Up #	EUT operating mode	Power Input	Antenna Gain
23 °C	1	2	5 VDC	15 dBi

8.1.4 Measurement result:

Plot #	Frequency (GHz)	EUT operating mode	Maximum Peak Conducted Output Power (dBm)	EIRP (dBm)	Limit (dBm)	Result
1-3	60-64	2	-10.59	4.41	-10 (conducted) / 10 (EIRP)	Pass

8.1.5 Measurement Plots:

Note: measured with the DSO, shows max. voltage = 3.5 mV at a distance of 10 cm to EUT.

Note: reproduce the max. voltage level of 3.5 mV with a signal generator and transmitting antenna at a distance of 78 cm.

Note: measured the conducted power from the signal generator of -2.75 dBm.

Antenna gain of the TX antenna AG_{TX} , which is attached to the signal generator: 25 dBi,

Free space loss FSL_1 of a signal at 62 GHz at a distance of 10 cm: 48.35 dB,

Free space loss FSL_2 of a signal at 62 GHz at a distance of 78 cm: 66.19 dB,

Thus the equivalent radiated power of the EUT calculates:

$$\begin{aligned}
 EIRP_{EUT} &= P_{\text{sensor}} + AG_{TX} - FSL_2 + FSL_1 \\
 &= -2.75 \text{ dBm} + 25 \text{ dB} - 66.19 \text{ dB} + 48.35 \text{ dB} = 4.41 \text{ dBm}
 \end{aligned}$$

$$\begin{aligned}
 \text{Conducted power} &= EIRP - AG (15 \text{ dBi}) \\
 &= -10.59 \text{ dBm}
 \end{aligned}$$

8.2 6 dB Bandwidth

8.2.1 Measurement according to ANSI C63.10 Section 6.9.2

Spectrum Analyzer settings:

- Span: approximately 2 to 3 times the emission bandwidth, centered on the carrier frequency
- RBW = as specified in the requirement
- VBW = as specified in the requirement
- Sweep Time = Auto couple
- Detector = Peak
- Trace = Max hold

8.2.2 Limits: FCC §15.255(e)(1), RSS-210 J.4 (c)

FCC §15.255(e)(1):

For the purposes of this paragraph, emission bandwidth is defined as the instantaneous frequency range occupied by a steady state radiated signal with modulation, outside which the radiated power spectral density never exceeds 6 dB below the maximum radiated power spectral density in the band, as measured with a 100 kHz resolution bandwidth spectrum analyzer. The center frequency must be stationary during the measurement interval, even if not stationary during normal operation (e.g., for frequency hopping devices).

RSS-210 J.4 (c):

For the purpose of this standard, emission bandwidth is defined as the instantaneous frequency range occupied by a steady radiated signal with modulation, outside which the radiated power spectral density shall be 6 dB below the maximum radiated power spectral density in the band, as measured with a 100 kHz resolution bandwidth. The centre frequency must be stationary during the measurement interval, even if not stationary during normal operation.

8.2.3 Test conditions and setup:

Ambient Temperature	EUT Set-Up #	EUT operating mode	Power Input
22° C	2		5 VDC

8.2.4 Measurement result:

Plot #	EUT operating mode	6 dB Bandwidth (GHz)
1	2	2.16039

8.2.5 Measurement Plots:

8.3 99% Occupied Bandwidth

8.3.1 Measurement according to RSS-Gen 6.7

Spectrum Analyzer settings:

- Span: approximately 2 to 3 times the emission bandwidth, around the carrier frequency
- RBW = 1% to 5% of the actual occupied bandwidth
- VBW = not smaller than three times the RBW
- Sweep Time = Auto couple
- Detector = Sample or Peak
- Trace = Max hold

8.3.2 Limits: - (for information only)

8.3.3 Test conditions and setup:

Ambient Temperature	EUT Set-Up #	EUT operating mode	Power Input
22 °C	1	2	5 VDC

8.3.4 Measurement result:

Plot #	EUT operating mode	99% Occupied Bandwidth (GHz)
1	2	3.32162

8.3.5 Measurement Plots:

8.4 Frequency Stability

8.4.1 Measurement according to ANSI C63.10 Section 9.14

Spectrum Analyzer settings:

- Span: approximately 2 to 3 times the emission bandwidth, around the carrier frequency
- RBW = 1% to 5% of the actual occupied bandwidth
- VBW = not smaller than three times the RBW
- Sweep Time = Auto couple
- Detector = Sample or Peak
- Trace = Max hold

8.4.2 Limits: FCC §15.255(f), RSS-210 J.6

FCC §15.255(f):

Fundamental emissions must be contained within the frequency bands specified in this section during all conditions of operation. Equipment is presumed to operate over the temperature range -20 to + 50 degrees Celsius with an input voltage variation of 85% to 115% of rated input voltage, unless justification is presented to demonstrate otherwise.

RSS-210 J.6:

Fundamental emissions shall be contained within the 57-71 GHz frequency band during all conditions of operation when tested at the temperature and voltage variations specified for the frequency stability measurement in RSS-Gen.

8.4.3 Test conditions and setup:

Ambient Temperature	EUT Set-Up #	EUT operating mode	Power Input
20 °C	1	2	5 VDC

8.4.4 Measurement result:

Plot #	Voltage (V)	Temperature (°C)	F_low (GHz)	F_high (GHz)	Limit (GHz)	Verdict
1	5	20	60.317814	63.76789	57-71	Complies
2	4.25	20	60.318564	63.661495	57-71	Complies
3	5.75	20	60.318246	63.65891	57-71	Complies
4	5	0	60.321202	63.649895	57-71	Complies
5	5	10	60.321391	63.651232	57-71	Complies
6	5	30	60.321134	63.652437	57-71	Complies
7	5	40	60.321224	63.651206	57-71	Complies

8.4.5 Measurement Plots:

8.5 Transmitter Spurious Emissions and Restricted Bands

8.5.1 Measurement according to ANSI C63.10

Analyzer Settings:

- Frequency = 9 KHz – 30 MHz
- RBW = 9 KHz
- Detector = Peak

- Frequency = 30 MHz – 1 GHz
- Detector = Peak / Quasi-Peak
- RBW = 120 KHz (<1 GHz)

- Frequency > 1 GHz
- Detector = Peak / Power Average
- RBW = 1 MHz

- Radiated spurious emissions shall be measured for the transmit frequencies, transmit power, and data rate for the lowest, middle and highest channel in each frequency band of operation and for the highest gain antenna for each antenna type, and using the appropriate parameters and test requirements.
- The highest (or worst-case) emission level shall be recorded for each measurement.
- For testing frequencies below 30 MHz at distance other than the specified in the standard, the limit conversion is calculated by using the FCC materials for the ANSI 63 committee issued on January, 27 1991.
- For testing frequencies above 40 GHz external harmonic mixers are applied to down-convert the signal for the spectrum analyzer. The lack of tracking preselector for the external mixer can result in image frequencies, which requires confirmation. The spectrum analyzer applies the signal ID function to identify the image frequencies.

Measuring distance:

All measurements in the frequency range 40-200 GHz are done in far-field of the measurement antenna. The far-field boundary $d_{far-field}$ is

$$d_{far-field} = D^2 / \lambda$$

Where

D is the max. dimension size of the measurement antenna
 λ is the wavelength of the measured emission.

The following table illustrates the far-field boundary for the setup of each test frequency range:

Frequency range	Min. Wavelength	Max. dimension size of the meas. ant.	Far-field boundary
GHz	m	m	m
40-60	0.0050	0.049	0.96
60-90	0.0033	0.036	0.78
90-140	0.0021	0.021	0.41
140-200	0.0015	0.014	0.26

In order to conduct measurements in the far-field and acquire adequate dynamic, the measurement antenna is set at 1 m to the EUT for test frequencies above 40 GHz.

8.5.2 Limits: FCC 15.255(d) / 15.209(a) / RSS-210 J.3 / RSS-Gen 6.13

Restricted bands

MHz	MHz	MHz	GHz
0.090-0.110	16.42-16.423	399.9-410	4.5-5.15
10.495-0.505	16.69475-16.69525	608-614	5.35-5.46
2.1735-2.1905	16.80425-16.80475	960-1240	7.25-7.75
4.125-4.128	25.5-25.67	1300-1427	8.025-8.5
4.17725-4.17775	37.5-38.25	1435-1626.5	9.0-9.2
4.20725-4.20775	73-74.6	1645.5-1646.5	9.3-9.5
6.215-6.218	74.8-75.2	1660-1710	10.6-12.7
6.26775-6.26825	108-121.94	1718.8-1722.2	13.25-13.4
6.31175-6.31225	123-138	2200-2300	14.47-14.5
8.291-8.294	149.9-150.05	2310-2390	15.35-16.2
8.362-8.366	156.52475-156.52525	2483.5-2500	17.7-21.4
8.37625-8.38675	156.7-156.9	2690-2900	22.01-23.12
8.41425-8.41475	162.0125-167.17	3260-3267	23.6-24.0
12.29-12.293	167.72-173.2	3332-3339	31.2-31.8
12.51975-12.52025	240-285	3345.8-3358	36.43-36.5
12.57675-12.57725	322-335.4	3600-4400	Above 38.6
13.36-13.41			

- Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).
- PEAK LIMIT = 74 dBµV/m
- AVG. LIMIT = 54 dBµV/m
- Except as shown in CFR 47 Part 15.205 paragraph (d), only spurious emissions are permitted in any of the frequency bands listed below

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	300
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30
30-88	100**	3
88-216	150**	3
216-960	200**	3
Above 960	500	3

Between 40 GHz and 200 GHz, the level of these emissions shall not exceed 90 pW/cm² at a distance of 3 meters, as defined in §15.255(d), which is equivalent to -9.92 dBm EIRP. The limit conversion is according to ANSI C63.10 formula (25):

$$PD = \frac{EIRP_{Linear}}{4\pi d^2}$$

Where

- PD* is the power density at the distance specified by the limit, in W/m²
- EIRP_{Linear}* is the equivalent isotropic radiated power, in watts
- D* is the distance at which the power density limit is specified, in m

8.5.3 Test conditions and setup:

Ambient Temperature	EUT Set-Up #	EUT operating mode	Power Input
20 °C	1	1	5 VDC

8.5.4 Measurement result:

Plot #	Channel #	Scan Frequency	Limit	Result
1-14	Low	9 kHz – 18 GHz, 40 GHz - 200 GHz	See section 8.5.2	Complies
15-31	Mid	9 kHz – 200 GHz	See section 8.5.2	Complies
32-39	High	9 kHz – 18 GHz, 40 GHz - 200 GHz	See section 8.5.2	Complies

8.5.5 Measurement Plots:

The worst case EUT position is determined by comparing fundamental emission level before the test. The tests are carried out at worst case position, which is standing position.

8.5.5.1 Frequency low

Final_Result

Frequency (MHz)	MaxPeak (dBμV/m)	CAverage (dBμV/m)	Limit (dBμV/m)	Margin (dB)	Meas. Time (ms)	Bandwidth (kHz)	Height (cm)	Pol	Azi mut	Corr .

8.1 AC Conducted Emissions

8.1.1 Measurement according to ANSI C63.4

Analyzer Settings:

- RBW = 9 KHz (CISPR Bandwidth)
- Pre-scan Detector = Peak / Average for
- Final Measurements Detector = Quasi-Peak / Average

8.1.2 Limits: FCC 15.207 & RSS-Gen 8.8

(a) Except as shown in paragraphs (b) and (c) of this section of the CFR, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table (1), as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between frequency ranges.

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

*Decreases with the logarithm of the frequency.

8.1.3 Test conditions and setup:

Ambient Temperature (°C)	EUT Set-Up #	EUT operating mode	Power line (L1, L2, L3, N)	Power Input
20	1	2	Line & Neutral	110 V / 60 Hz

8.1.4 Measurement Result:

Plot #	Port	EUT Set-Up #	EUT operating mode	Scan Frequency	Limit	Result
1	AC Mains	1	2	150 kHz – 30 MHz	See section 8.1.2	Complies

8.1.5 Measurement Plots:

Note: Equipment used meets the measurement uncertainty requirements as required per applicable standards for 95% confidence levels. Calibration due dates, unless defined specifically, falls on the last day of the month. Items indicated "N/A" for cal status either do not specifically require calibration or is internally characterized before use.
