3 GENERAL PRODUCT INFORMATION

3.1 Product Function and Intended Use

- S-node is a tiny, truly plug-and-play sensor node designed to enable predictive maintenance at a fingertip. A tiny, ultra-low power sensor nodes communicate with each other in a secure mesh network to send the sensor's raw data to the cloud via a gateway.
- S-node is used for measure 3D vibration, acoustic emissions, gas emissions, RPM, and IR thermal.

3.2 Ratings and System Details of Equipment under Test

Table 3: Ratings and System Details as declared by Client*

Radio Protocol	ZigBee
Operating Frequency Range	2405MHz to 2480MHz
Channel Spacing	5 MHz
Tx Transmitting Power	-20 to to +6 dBm
Maximum Measured Power	6.96 dBm @ 2405MHz
Modulation	O-QPSK
Data Rate	250 kbps
Number of antennas	1
Antenna Gain & Antenna Type	1.5 dBi & PCB antenna
Antenna Model	B
Supply Voltage to Product	Li-Po Battery: 500mAh/3.7V or DC 5V from USB,
	System Supply Voltage 2.5V
Environmental conditions	-40°C to 85°C
EUT Dimension	Height: 70 mm , S-Node Ring Diameter: 60 mm

***Disclaimer:** The information/data is supplied by the client and the same is considered to arrive at the final value. Any changes made apart from the specified specification, can directly impact on the tests results. Refer the products user manual for more details.

3.3 Measurement Uncertainty:

Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of $k = 2$

Table 4: Measurement Uncertainty

Parameter	Uncertainty
Occupied Channel Bandwidth	$\pm 5 \%$
RF output power, conducted	$\pm 1.5 \text{ dB}$
Power Spectral Density, conducted	$\pm 3 \text{ dB}$
Unwanted Emissions, conducted	$\pm 3 \text{ dB}$
All emissions, radiated	$\pm 6 \text{ dB}$
Temperature	$\pm 3 \text{ }^{\circ}\text{C}$
Supply Voltages	$\pm 3 \%$
Time	$\pm 5 \%$

Note: The Listed Measurement Uncertainties are the worst-case uncertainty, for the respective test cases. Above Table is for reporting purpose only and not used in determining Final Pass/Fail verdict.

5 OPERATIONAL DESCRIPTION

- **S-node Theory of Operations**

S-node is the Dotcom IoT LLP's flagship product, which is designed for Industry 4.0 to make predictive maintenance easy without prior expertise in IoT and machine learning.

It's a tiny, battery-operated wireless device, which sends the sensor's raw data to the gateway by forming the secure wireless mesh network on top of the OpenThread.

The hardware section is divided into the two parts:

1. Motherboard
2. Sensor board

The S-Node supports the plug-and-play architecture which allows plugging sensors board as per the application and industrial needs.

The B2B connector is used to attach the sensor board to the motherboard.

- **SoC/MCU Section**

As per the block diagram, **nRF82540** is the heart of the motherboard which is the High-end multiprotocol Bluetooth Low Energy (LE) SoC. it supports Bluetooth 5.3/Bluetooth mesh/Thread/ Zigbee/802.15.4/ANT.

nRF52840 is the soc with 64 MHz Arm® Cortex-M4 with FPU capability from the **Nordic Semiconductor**.

The sensor communicates with the Motherboard with either I2C, SPI, or UART-based communication depending on the sensors type and supported communication protocol.

- **Power section**

The power section is embedded with the **PMIC**, power switch, and Li-Po Battery. PMIC is responsible for battery charging, battery voltage, load current measurements, and battery health status monitoring. PMIC is digital and communicating with the soc via I2C.

S-node is powered by a **Li-Po Battery** having a capacity of 500 to 2000 mAh/3.7V.

The battery can be charged via **micro USB** with any generic 5V/2A android charger.

- **Storage Section**

S-node supports solid-state storage in form of the **4MB QSPI flash**. QSPI flash is used to store the node configuration, and to store the binary file during the OTA update.

The node also has the SD card socket to insert the **SD card** up to 8GB of storage.

The SD card is used to store the offline sampling data in case of the wireless connectivity failures.

- **Debug section**

Along with the charging, a **micro USB** is also used for the debugging purpose.

The USB supporting the CDC communication to emulate the virtual comm port with the serial terminal.

- **Debug section**

Along with the charging, a **micro USB** is also used for the debugging purpose.
The USB supporting the CDC communication to emulate the virtual com port with the serial terminal.

- **User button & LED**

The **RGB LED** is used for the communication status indication of the Node.
The switch is attached to the GPIO, which is the user-programmable output pin.

- **Load switches**

Load switches are the solid-state switches that are controlled over the GPIO of the soc.
The main functionality of the load switches is to put off the devices when not to use or in low-power modes.

- **Matching Network, RF section, and antenna**

Matching to 50 ohms: The output impedance of the chip is not 50 ohms. Therefore a matching network needs to be inserted between the chip and the reference point.
There are basically two types of antenna matching networks; a pi-network and a matching network consisting of one shunt component only. The type of antenna decides which matching network to use.
If using a PCB antenna, the matching network should consist of one shunt component, and if using a chip antenna, the matching network should be a pi-network.

S-node is embedded with the PCB antenna having 1.5dBi gain

6 TEST METHODOLOGY

6.1 Conducted Spurious Emission Test on AC Power lines

Measured levels of ac power-line conducted emission across the 50Ω LISN port (to which the EUT is connected). All emission voltage and current measurements shall be made on each current-carrying conductor at the plug end of the EUT power cord by the use of mating plugs and receptacles on the LISN, if used. Equipment shall be tested with power cords that are normally supplied or recommended by the manufacturer and that have electrical and shielding characteristics that are the same as those cords normally supplied or recommended by the manufacturer.

The device is placed on the test table, raised 80cm above the reference ground plane. The vertical conducting plane is located 40cm to the rear of the device. AC Conducted emission measurement is made over frequency range from 150kHz to 30MHz, this measurement was performed with EUT powered by 2 methods and both method are tested individually, one with an AC adaptor with 110V AC 60Hz supply and second with Wireless charger with supply 110V AC 60Hz.

6.1.1 Test Setup Configuration

6.2 Radiated Emission Test

The radiated emission measurement was performed according to the procedures in ANSI C63.10-2013. The equipment under test (EUT) was placed at the middle of the 80 cm high turntable for below 1 GHz & 1.5 m height for above 1 GHz measurement, and the EUT is 3 meters far from the measuring antenna. The turntable was rotated 360° for obtaining the maximum emission. The height of the measuring antennas was scanned between 1 m and 4 m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained. The measurement above 1000 MHz was performed by horn antenna, The measurement below 30 MHz was performed by loop antenna, Measurement from 30 MHz to 200 MHz was performed by Baloon and Biconical Antenna, and measurement from 200 MHz to 1 GHz was performed by Log-Periodic Antenna.

The EUT was rotated around the X-, Y-, and Z-Axis and the results from worst case axis are recorded

6.2.1 Test Setup Configuration

7.4 Spurious Radiated Emissions & Restricted Bands of Operation

Result

Pass

Test Specification	FCC part 15 Subpart C 15.247 (d) / (15.209 & 15.205)
Test Method	ANSI C63.10
Measurement Location	Semi Anechoic Chamber 9kHz - 1 GHz Fully Anechoic Chamber 1 GHz - 40GHz
Measurement Bandwidth	100 kHz for frequency range < 1GHz 1 MHz for Frequency range >1GHz
Detector	Refer remarks below
Measuring Distance	3 m
Requirement	As per the limits mentioned in the below table
Test setup	Refer TEST METHODOLOGY

Table 6: Transmitter limits for Radiated emission

Frequency (MHz)	Field strength (μV/m)	Field strength (dBμV/m)	Distance of Measurement (m)
0.009 – 0.490	2400/F(kHz)	48.50 – 13.80	300*
0.490 – 1.705	24000/F(kHz)	33.80 – 23.00	30*
1.705 -30	30	29.54	30*
30-88	100	40.0	3
88-216	150	43.5	3
216-960	200	46.0	3
Above 960	500	54.0	3

Remark: * The limit shows in the table above of frequency range 0.009 – 0.490, 0.490 – 1.705 MHz and 1.705-30MHz is at 300 meter, 30 meter and 30 meter range respectively, which corresponds to 128.51 – 93.80, 73.80 – 62.96 and 69.54 dBμV/m at 3m range by extrapolation calculation and the measurement of loop antenna.

The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9–90 kHz, 110–490 kHz and above 1000 MHz Radiated emission limits in these three bands are based on measurements employing an average detector.

Test Condition

Normal Test Condition:

Temperature (Norm) = + 22.1 °C **Voltage** = Li-Po Battery 500mAh/3.7V or DC 5V from USB **Relative humidity** = 65%

Prüfbericht - Nr.:

Test Report No.:

ULR-TC568822300000106F

Seite 37 von 51

Page 37 of 51

Test results:

Note: All the losses are included during measurement and final values are mentioned in the test report. Refer TEST METHODOLOGY for more details

Test results for frequency range 9kHz – 30MHz

No emissions found in frequency range 9 kHz to 30 MHz, and measured levels are below 20dB from the limit line, hence not reported

Table 7: Test results for frequency range 30MHz – 200MHz

Battery Mode:-

Antenna Polarization	Measured Frequency (MHz)	Measured Emission (dBμV/m)	Limit (dBμV/m)	Margin (dB)
Vertical	53.16(Pk)	15.80	40.00	-24.20

7.5 Conducted spurious emission Test on AC Power lines

Result

Pass

Test Specification : FCC Part 15 Section 15.207
Test Method : ANSI C 63.10-2013
Testing Location : Screened room
Measurement Bandwidth : 9kHz
Frequency Range : 150kHz – 30MHz
Supply Voltage : 110VAC,60Hz
Test Method : Refer TEST METHODOLOGY

Table 10: Limits for Conducted poweline emission

Frequency of emission (MHz)	Conducted limit (dBµV)	
	Quasi-peak (dBµV)	Average (dBµV)
0.15-0.5	66-56*	56-46*
0.5-5	56	46
5-30	60	50

* Decreases with the logarithm of the frequency
