CERTIFICATION TEST REPORT

Manufacturer: LTA Research and Exploration, LLC
642 North Pastoria Avenue
Sunnyvale, California 94085 USA

Applicant: Same as Above

Product Name: Freeballooning Wireless Module

Product Description: Wireless MCU operating in the 902-928 MHz band that provides a serial connection between up to 15 devices through a transparent wireless link.

Model: A4832_01

FCC ID: 2A9X4A4832-01

Testing Commenced: 2023-02-14

Testing Ended: 2023-07-18

Summary of Test Results: In Compliance

The EUT complies with the EMC requirements when manufactured identically as the unit tested in this report, including any required modifications and/or manufacturer's statement. Any changes to the design or build of this unit subsequent to this testing may deem it non-compliant.

Rules:

- **FCC Part 15 Subpart C, Section 15.247**
- **FCC15.207 - Conducted Limits**
- **FCC Part 15.31(e)**
- **ANSI C63.10:2013**

Evaluation Conducted by:

Julius Chiller, Senior Wireless Project Engineer

1 ADMINISTRATIVE INFORMATION

1.1 Measurement Location:

F2 Labs in Middlefield, Ohio. Site description and attenuation data are on file with the FCC's Sampling and Measurement Branch at the FCC Laboratory in Columbia, MD.

1.2 Measurement Procedure:

All measurements were performed according to ANSI C63.10 and recommended FCC procedure of measurement under Section 15.247 and in KDB558074. A list of the measurement equipment can be found in Section 6.

1.3 Uncertainty Budget:

The uncertainty in EMC measurements arises from several factors which affect the results, some associated with environmental conditions in the measurement room, the test equipment being used, and the measurement techniques adopted.

The measurement uncertainty budgets detailed below are calculated from the test and calibration data and are expressed with a 95% confidence factor. Note: Only measurements listed below which relate to tests included in this Test Report are applicable to it.

Measurement Range	Expanded Uncertainty	Combined Uncertainty
Radiated Emissions <1 GHz @ 3m	$\pm 5.07\text{dB}$	± 2.54
Radiated Emissions <1 GHz @10m	$\pm 5.09\text{dB}$	± 2.55
Radiated Emissions 1 GHz to 2.7 GHz	$\pm 3.62\text{dB}$	± 1.81
Radiated Emissions 2.7 GHz to 18 GHz	$\pm 3.10\text{dB}$	± 1.55
AC Power Line Conducted Emissions, 150kHz to 30 MHz	$\pm 2.76\text{dB}$	± 1.38

This Uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k=2$.

4 ENGINEERING STATEMENT

This report has been prepared on behalf of LTA Research and Exploration, LLC to provide documentation for the testing described herein. This equipment has been tested and found to comply with Part 15.247 of the FCC Rules using ANSI C63.10 and KDB558074 standards. The test results found in this test report relate only to the items tested.

5 EUT INFORMATION AND DATA

5.1 Equipment Under Test:

Product: Freeballooning Wireless Module

Model: A4832_01

Serial No.: 20419-0012

FCC ID: 2A9X4A4832-01

5.2 Trade Name:

LTA Research and Exploration, LLC

5.3 Power Supply:

3.6VDC

5.4 Applicable Rules:

CFR 47, Part 15.247, subpart C

5.5 Equipment Category:

Radio Transmitter- Hybrid

5.6 Antenna:

Laird model TRAM8903NP, s/n 09

5.7 Accessories:

N/A

5.8 Test Item Condition:

The equipment to be tested was received in good condition.

5.9 Testing Algorithm:

EUT was operated in hybrid mode on the low, mid and high channels in the 902-928 MHz band. Timing measurements were made in the frequency hopping mode, powered at 3.6VDC. The highest emissions were recorded in the data tables.

7 OCCUPIED BANDWIDTH

7.1 Requirements:

For frequency hopping systems operating in the 902-928 MHz band

The maximum allowed 20dB bandwidth of the hopping channel is 500 kHz.

Bandwidth measurements were made at the low, mid and high frequencies. The 20dB bandwidth was measured using the marker delta method.

7.2 Occupied Bandwidth Test Data

Test Date:	2023-04-19	Test Engineer:	J. Chiller

8 CONDUCTED OUTPUT POWER

The EUT antenna port was fitted with an SMA connector and directly connected to the input of the receiver. The peak power output was measured.

8.1 Requirements:

For frequency hopping systems operating in the 902-928 MHz band: 1 watt (30 dBm) for systems employing at least 50 hopping channels; and 0.25 watts (24 dBm) for systems employing less than 50 hopping channels, but at least 25 hopping channels, as permitted under paragraph (a)(1)(i).

9 CONDUCTED SPURIOUS EMISSIONS

The following tests were performed to demonstrate compliance.

RF Antenna Conducted Test

The EUT antenna port was fitted with an SMA connector and directly connected to the input of the spectrum analyzer/receiver.

9.1 Requirements:

All Spurious Emissions must be at least 20dB down from the highest emission level measured within the authorized band up through the tenth harmonic.

Spurious emissions measurements were made at the low, mid, and upper channels with the appropriate spectrum analyzer resolution bandwidth. Additionally, 20dB down points were measured for the low and high channels to verify band edge compliance.

10 RADIATED SPURIOUS EMISSION

The EUT antenna port was fitted with 3dB gain antenna. Radiated emissions were measured in a Semi-Anechoic Chamber. All emissions generated that fall in the restricted bands per FCC Part 15.205 were examined.

10.1 Requirements:

All emissions that fall in the restricted bands defined in FCC Part 15.205 shall not exceed the maximum field strength listed in FCC Part 15.209(a).

10.2 Radiated Spurious Emission Test Data

Test Date(s):	2023-04-19	Test Engineer:	J. Chiller
Standard(s):	CFR 47 Part 15.247(d); Part 15.209 / KDB558074	Air Temperature:	21.1°C
		Relative Humidity:	43%

Notes: Plots are peak, max hold prescan data included only to determine what frequencies to investigate and measure. The EUT was initially placed in a semi-anechoic chamber and rotated in all three orthogonal positions to maximize the emissions. Scans were performed from 150 kHz up to the 10th harmonic of the highest frequency generated. Characterization measurements were then performed to determine at which frequencies significant emissions occurred. These graphs are shown in the data presented.

The equipment was fully exercised with all cabling attached to the EUT and was positioned in the Semi-Anechoic Chamber for maximum emissions. While the equipment was energized, the receiving antenna was scanned from 1.0 meter to 4.0 meters in both vertical and horizontal polarities while the turntable was adjusted 360 degrees to determine the maximum field strength.

Scans were performed from 9kHz to 10 GHz at the low, mid, and high channels and the mid channel was determined to be the worst case. Tables of measured results in the presented test data include measurements from all channels.

11 FCC PART 15.247(f) – PEAK POWER SPECTRAL DENSITY (PSD)

Peak power spectral density measurements were performed.

11.1 Requirements:

The power spectral density conducted from the intentional radiator to the antenna due to the digital modulation operation of the hybrid system, with the frequency hopping operation turned off, shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

Power spectral density measurements were performed at a resolution bandwidth of 3 kHz (video bandwidth set at 10 kHz). The peak spectral densities were measured at the low, mid and upper channels.

11.2 Peak Power Spectral Density Test Data

Test Date(s):	2023-04-19	Test Engineer:	J. Chiller

12 ANSI 63.10 7.8.2 - FREQUENCY SEPARATION

EUT was directly connected to the analyzer with the Hopping function on.

12.1 Requirements:

Frequency separation must be greater than 25kHz or 20dB bandwidth of the Hopping Channel, whichever is greater.

12.2 Frequency Separation Test Data

Test Date(s):	2023-04-21	Test Engineer:	J. Chiller
Standards:	ANSI 63.10 7.8.2	Air Temperature:	21.2°C
		Relative Humidity:	34%

Limit: >409kHz (maximum 20dB OBW)

Verified all channels had a frequency separation claimed by the manufacturer. All channels had 6.165 MHz separation.

Date: 21.APR.2023 10:41:35

13 HYBRID HOPPING FREQUENCIES

The EUT was directly connected to the measurement device through an SMA connector. With the hopping enabled, the EUT was checked to ensure all of the hopping channels were present.

13.1 Requirements:

For the purposes of this section, hybrid systems are those that employ a combination of both frequency hopping and digital modulation techniques. The frequency hopping operation of the hybrid system, with the direct sequence or digital modulation operation turned off, shall have an average time of occupancy on any frequency not to exceed 0.4 seconds within a time period in seconds equal to the number of hopping frequencies employed multiplied by 0.4.

13.2 Number of Hopping Frequencies Test Data

Test Date(s):	2023-04-19	Test Engineer:	J. Chiller
Standards:	CFR 47 Part 15.247(f)	Air Temperature:	21.2°C
		Relative Humidity:	34%

Manufacturer declares 5 hybrid channels. All channels were verified.

Date: 21.APR.2023 10:41:35

14 FCC PART 15.247(f) – DWELL TIME

Test was to verify the dwell time on any channel while Hopping was on. EUT was directly connected to analyzer. The plots on the following page show how long a transmission is, and the transmissions in two (2) seconds.

14.1 Requirements:

Limit of 0.4 seconds in a 2-second period. (400ms x 5 channels)

14.2 Dwell Time Test Data

Test Date(s):	2023-04-19	Test Engineer:	J. Chiller
Standard(s):	CFR 47 Part 15.247(f)	Air Temperature:	21.6°C

15 CONDUCTED EMISSIONS

15.1 Requirements

In accordance with FCC CFR 47 Part 15.207(a), "Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency of Emission (MHz)	Conducted Limit (dB μ V)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

*Decreases with the logarithm of the frequency.

15.2 Procedure

The EUT was placed on a 1.0 x 1.5 meter non-conductive table, 0.8 meter above a horizontal ground plane and 0.4 meter from a vertical ground plane. Power was provided to the EUT through a LISN bonded to a 3 x 2 meter ground plane. The LISN and peripherals were supplied power through a filtered AC power source. The output of the LISN was connected to the input of the receiver via a transient limiter, and emissions in the range 150 kHz to 30 MHz were measured. The measurements were recorded using the quasi-peak and average detectors as directed by the standard, and the resolution bandwidth during testing was 9 kHz. The raw measurements were corrected to allow for attenuation from the LISN, transient limiter and cables.

15.3 Conducted Emissions Test Data

Test Date:	2023-02-14	Test Engineer:	J. Chiller
Rule:	15.207	Air Temperature:	20.3° C
Test Results:	Pass	Relative Humidity:	33%

Conducted Test – Line 1: 0.15 MHz to 0.5 MHz

Conducted Test – Line 1: 0.5 MHz to 5.0 MHz

Conducted Test – Line 1: 5.0 MHz to 30.0 MHz

Note: All peak scans are below AVG limit.

Conducted Test – Line 2: 0.15 MHz to 0.5 MHz

Conducted Test – Line 2: 0.5 MHz to 5.0 MHz

Conducted Test – Line 2: 5.0 MHz to 30.0 MHz

Note: All peak scans are below AVG limit.

16 VOLTAGE VARIATIONS

16.1 Requirements

For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery-operated equipment, the equipment tests shall be performed using a new battery.

16.2 Voltage Variations Test Data

Test Date(s):	2023-07-18	Test Engineer:	J. Chiller
Rule:	15.31(e)	Air Temperature:	22.2° C
Test Results:	Complies	Relative Humidity:	44%

Note: EUT ceases to function below 2.9VDC. 4.1VDC is manufacturer's maximum operational voltage.
