4 Subject of Investigation.

The objective of the measurements done by CETECOM Inc. was to evaluate the compliance of the EUT against the relevant Requirements specified in the Code of Federal Regulations Title 47 parts 15B.

4.1 Dates Of Testing

03/29/2016 - 04/21/2016

4.2 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests apparatus, with 95% confidence interval (in dB delta to result), based on a coverage factor k=1.

Radiated measurement

9 kHz to 30MHz	+/- 2.5 dB (Magnetic Loop Antenna)
30 MHz to 1000 MHz	+/- 2.0 dB (Biconilog Antenna)
1 GHz to 40 GHz	+/- 2.3 dB (Horn Antenna)

Conducted measurement

150 kHz to 30 MHz	+/- 0.7 dB (LISN)
RF conducted measurements	+/- 0.5 dB

4.3 Environmental Conditions during Testing

The following environmental conditions were maintained during the course of testing:

- * Ambient Temperature: 20-25oC
- * Relative humidity: 40-60%

Deviating test conditions are indicated at individual test description where applicable.

5 Measurements Procedures

Testing is performed according to the guidelines provided in FCC publication (KDB) 971168 DOI v02r02 - "Measurement Guidance for Certification of Licensed Digital Transmitters" and according to relevant parts of TIA-603C 2004 as detailed below.

5.1 Radiated Measurement

- The exploratory measurement is accomplished by running a matrix of 16 sweeps over the required frequency range with R&S Test-SW EMC32 for 4 positions of the turntable, two orthogonal positions of the EUT and both antenna polarizations. This procedure exceeds the requirement of the above standards to cover the 3 orthogonal axis of the EUT. A max peak detector is utilized during the exploratory measurement. The Test-SW creates an overall maximum trace for all 12 sweeps and saves the settings for each point of this trace. The maximum trace is part of the test report.
- The 10 highest emissions are selected with an automatic algorithm of EMC32 searching for peaks in the noise Door and ensuring that broadband signals are not selected multiple times.
- The maxima are then put through the final measurement and again maximized in a 90deg range of the turntable, fine search in frequency domain and height scan between 1m and 4m.
- The above procedure is repeated for all possible ways of power supply to EUT and for all supported modulations.
- In case there are no emissions above noise Door level only the maximum trace is reported as described above.
- The results are split up into up to 4 frequency ranges due to antenna bandwidth restrictions. A magnetic loop is used from 9 kHz to 30 MHz, a Biconilog antenna is used from 30 MHz to 1 GHz, and two different horn antennas are used to cover frequencies up to 40 GHz.

Radiated Emissions Test Setup 30MHz-1GHz Measurements

5.2 Sample Calculations for Radiated Measurements

Measurements from the spectrum analyzer or receiver are used to calculate the field strength, taking into account the following parameters:

- 1. Measured reading in dBμV
- 2. Cable Loss between the receiving antenna and spectrum analyzer or receiver in dB and
- 3. Antenna factor in dB/m

$$FS \text{ (dB}\mu\text{V/m)} = \text{Measured Value on SA (dB}\mu\text{V)} + \text{Cable Loss (dB)} + \text{Antenna Factor (dB/m)}$$

Example:

Frequency (MHz)	Measured SA (dBμV)	Cable Loss (dB)	Antenna Factor Correction (dB)	Field Strength Result (dBμV/m)
1000	80.5	3.5	14	98.0

All radiated measurement plots in this report are taken from test software that calculates the field strength based on the above equation.

5.3 AC Conducted Measurement Procedure:

- The EUT and accessories are placed on a non-conducting table 80 cm above the horizontal ground plane and 40 cm from the vertical ground plane.
- Cables that hang closer than 40 cm to the ground plane are gathered into a 30 cm to 40 cm long bundle.
- The power cable of the EUT is connected to the LISN.
- The 6 highest emissions within 20 dB of the limit are noted.
