

**Engineering Test Report No. 2000553-01**

Report Date	March 18, 2020
Manufacturer Name	Springs Window Fashions
Manufacturer Address	7549 Graber Road Middleton, WI 53562
Product Name Brand/Model No.	RSZ2
Date Received	March 12, 2020
Test Dates	March 12-13, 2020
Specifications	FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.207 and 15.249 FCC "Code of Federal Regulations" Title 47 Part 15, Subpart B, Section 15.107 and 15.109 Innovation, Science, and Economic Development Canada, RSS-210 and RSS-GEN Innovation, Science, and Economic Development Canada, ICES-003
Test Facility	Elite Electronic Engineering, Inc. 1516 Centre Circle, Downers Grove, IL 60515
Signature	
Tested by	Javier Cardenas
Signature	
Approved by	Raymond J. Klouda, Registered Professional Engineer of Illinois – 44894

This report is for your exclusive use. Any copying or replication of this report to or for any other person or entity, or use of our name or trademark, is permitted only with our prior written permission. This report sets forth our findings solely with respect to the test samples identified herein. The results set forth in this report are not indicative or representative of the quality or characteristics of the lot from which a test sample was taken or any similar or identical product unless specifically and expressly noted. Our report includes all of the tests requested by you and the results thereof based upon the information that you provided to us. You have 60 days from date of issuance of this report to notify us of any material error or omission caused by our negligence, provided, however, that such notice shall be in writing and shall specifically address the issue you wish to raise. A failure to raise such issue within the prescribed time shall constitute your unqualified acceptance of the completeness of this report, the tests conducted and the correctness of the report contents.

This report shall not be reproduced, except in full, without the written approval of Elite Electronic Engineering Inc.

Elite Electronic Engineering Incorporated certifies that the information contained in this report was obtained under conditions which meet or exceed those specified in the FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.207 and 15.249 and Innovation, Science, and Economic Development Canada, RSS-210 and RSS-GEN test specification(s). The data presented in this test report pertains to the EUT on the test date(s) specified. Any electrical or mechanical modifications made to the EUT subsequent to the specified test date will serve to invalidate the data and void this certification. This report must not be used to claim product certification, approval, or endorsement by A2LA, NIST, or any agency of the Federal Government.

1. Report Revision History

Revision	Date	Description
–	18 March 2020	Initial Release of Engineering Test Report No. 2000553-01

2. Introduction

This document presents the results of a series of electromagnetic compatibility (EMC) tests that were performed on Automated Window Shades (hereinafter referred to as the Equipment Under Test (EUT)). The EUT was identified as follows:

EUT Identification	
Description	Automated Window Shades
Model/Part No.	RSZ2
S/N	N/A
Number of Interconnection Wires	N/A
Type of Interconnection Wires	N/A
Highest Internal Frequency of the EUT:	916MHz
Occupied Bandwidth	143.86kHz
Output Power	-6dBm

The EUT listed above was/were used throughout the test series.

The EUT was submitted for testing along with the following support equipment:

Description	Model #	S/N
AC/DC Switching Power Supply	GT-41130-2016-1.0-W2	

3. Test Specification(s)

The tests were performed to selected portions of, and in accordance with the FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.207 and 15.249 test specification(s). It was also performed to the selected portions of, and in accordance with the Innovation, Science, and Economic Development Canada RSS-210 specifications

- Federal Communications Commission "Code of Federal Regulations", Title 47, Part 15, Subpart C
- ANSI C63.4-2014, "American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz"
- ANSI C63.10-2013, "American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices"
- ICES-003, Issue 6, January 2016, "Spectrum Management and Telecommunications, Interference-Causing Equipment Standard, Information Technology Equipment (Including Digital Apparatus) – Limits and methods of measurement"
-
- RSS-Gen Issue 5, March 2019, Amendment 1, Innovation, Science, and Economic Development Canada, "Spectrum Management and Telecommunications, Radio Standards Specification, General Requirements for Compliance of Radio Apparatus"
- RSS-210 Issue 10, December 2019, Innovation, Science, and Economic Development Canada, "License-Exempt Radio Apparatus: Category 1 Equipment"

4. Laboratory Conditions

The temperature at the time of the test was 21°C and the relative humidity was 16%.

5. Summary

The following EMC tests were performed and the results are shown below:

Test Description	Test Methods	Equipment Class	Results
RF Conducted Emissions Test (AC Mains)	FCC 15B FCC15C ISED RSS-GEN ISED ICES-003 ANSI C63.4-2014	B	Conforms
RF Radiated Emissions Test	FCC 15B ISED ICES-003 ANSI C63.4-2014	B	Conforms
Occupied Bandwidth	ISED RSS-210 ANSI C63.10-2013	-	Conforms
Field Strength and Radiated Spurious Emissions	FCC15C ISED RSS-210 ANSI C63.10-2013	-	Conforms
Band-Edge Compliance	FCC15C ISED RSS-GEN	-	Conforms

6. Test Plan

No test plan was provided. Instructions were provided by personnel from Springs Window Fashions and used in conjunction with the FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.207 and 15.249 and Innovation, Science, and Economic Development Canada, RSS-210 and RSS-GEN, and ANSI C63.4-2014 specification(s).

7. Grounding

The EUT was not grounded.

8. Modifications Made to EUT

No modifications were made to the EUT during the testing.

9. Deviations from Specification(s)

No deviations from the specification(s) were made during the testing.

10. Modes of Operation

The EMC tests were performed with the EUTs operating in one or more of the test modes described below. See the specific test section for the applicable test modes.

10.1. Transmitting

This mode was achieved by applying power to the device. The EUT was configured to transmit at the following frequencies:

- 908.4MHz
- 916MHz

10.2. Receiving and Motor Running

This mode was achieved by applying power to the EUT. The EUT was configured to receive and have the window shades' motor running.

11. Test Method

The tests were performed using the referenced methods described in the FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.207 and 15.249 and Innovation, Science, and Economic Development Canada, RSS-210 and RSS-GEN test specifications. The specific test sections and specification references are called out in the individual test sections.

12. Sample Calculations

For Powerline Conducted Emissions:

The resultant voltage level (VL) is a summation in decibels (dB) of the receiver meter reading (MTR) and the cable loss factor (CF).

$$\text{Formula 1: VL (dBuV) = MTR (dBuV) + CF (dB).}$$

For Radiated Emissions:

The resultant field strength (FS) is a summation in decibels (dB) of the receiver meter reading (MTR), the antenna correction factor (AF), and the cable loss factor (CF). If an external preamplifier is used, the total is reduced by its gain (-PA). If a distance correction (DC) is required, it is added to the total.

$$\text{Formula 1: FS (dBuV/m) = MTR (dBuV) + AF (dB/m) + CF (dB) + (- PA (dB)) + DC (dB)}$$

To convert the Field Strength dBuV/m term to uV/m, the dBuV/m is first divided by 20. The Base 10 AntiLog is taken of this quotient. The result is the Field Strength value in uV/m terms.

$$\text{Formula 2: FS (uV/m) = AntiLog [(FS (dBuV/m))/20]}$$

13. Statement of Conformity

The Springs Window Fashions Automated Window Shades, Model No. RSZ2 did fully conform to the selected requirements of FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.207 and 15.249 and Innovation, Science, and Economic Development Canada, RSS-210 and RSS-GEN.

14. Certification

Elite Electronic Engineering Incorporated certifies that the information contained in this report was obtained under conditions which meet or exceed those specified in the FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.207 and 15.249 and Innovation, Science, and Economic Development Canada, RSS-210 and RSS-GEN test specifications. The data presented in this test report pertains to the EUT on the test date specified. Any electrical or mechanical modifications made to the EUT subsequent to the specified test date will serve to invalidate the data and void this certification.

N/A: Not Applicable

I/O: Initial Only

CNR: Calibration Not Required

NOTE 1: For the purpose of this test, the equipment was calibrated over the specified frequency range, pulse rate, or modulation prior to the test or monitored by a calibrated instrument.

17. RF Conducted Emissions Test (AC Mains)

Manufacturer	Springs Window Fashions
Product	Automated Window Shades
Model	RSZ2
Serial No	N/A
Mode	Transmitting

Information	
Setup Format	Tabletop
Height of Support	N/A
Type of Test Site	Reverberation Chamber
Note	

Measurement Uncertainty	
Measurement Type	Expanded Measurement Uncertainty
Conducted disturbance (mains port) (150 kHz – 30 MHz)	2.7

Procedures
The interference on each power lead of the EUT was measured by connecting the measuring equipment to the appropriate meter terminal of the Line Impedance Stabilization Network (LISN). The meter terminal of the LISN not under test was terminated with 50 ohms. 1) The EUT was operated in the Transmitting mode. 2) Measurements were first made on the Voltage high line. 3) The frequency range from 150 kHz to 30 MHz was broken up into smaller frequency sub-bands. 4) Conducted emissions measurements were taken on the first frequency sub-band using a peak detector. 5) The data thus obtained was then searched by the computer for the highest levels. Any emissions levels that were within 10dB of the average limit were then measured again using both a quasi-peak detector and an average detector. (If no peak readings were within 10dB of the average limit, quasi-peak and average readings were taken on the highest emissions levels measured during the peak detector scan.) 6) Steps (4) and (5) were repeated for the remainder of the frequency sub-bands until the entire frequency range from 150kHz to 30MHz was investigated. The peak trace was automatically plotted. The plot also shows quasi-peak and average readings that were taken on discrete frequencies. A table showing the quasi-peak and average readings was also generated. This tabular data compares the quasi-peak and average conducted emissions to the applicable conducted emissions limits. 7) Steps (3) through (6) were repeated on the Voltage neutral line. 8) Steps (2) through (7) were repeated with the EUT operated in the Receiving and Motor Running mode.

18. RF Radiated Emissions Test

Manufacturer	Springs Window Fashions
Product	Automated Window Shades
Model	RSZ2
Serial No	N/A
Mode	Receiving and Motor Running

Information	
Setup Format	Tabletop
Height of Support	N/A
Type of Test Site	Semi-Anechoic Chamber
Type of Antennas Used	Below 1GHz: Bilog (or equivalent) Above 1GHz: Double-ridged waveguide (or equivalent)
Highest Internal Frequency of the EUT:	916MHz
Highest Measurement Frequency:	10GHz
Notes	The cables were manually maximized during the preliminary emissions sweeps. The cable arrangement which resulted in the worst-case emissions was utilized.

Measurement Uncertainty	
Measurement Type	Expanded Measurement Uncertainty
Radiated disturbance (electric field strength on an open area test site or alternative test site) (30 MHz – 1000 MHz)	4.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (1 GHz – 6 GHz)	3.1
Radiated disturbance (electric field strength on an open area test site or alternative test site) (6 GHz – 18 GHz)	3.2
Radiated disturbance (electric field strength on an open area test site or alternative test site) (18 GHz – 26.5 GHz)	3.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (26.5 GHz – 40 GHz)	3.4

Procedures

Since a quasi-peak detector and an average detector requires a long integration times, it is not practical to automatically sweep through the quasi-peak and average levels. Therefore, radiated emissions from the EUT were first scanned using a peak detector and automatically plotted. The frequencies where significant emission levels were noted were then remeasured using the quasi-peak detector or average detector.

The EUT and all peripheral equipment were placed on an 80cm high non-conductive stand. The broadband measuring antenna was positioned at a 3 meter distance from the EUT. The frequency range from 30MHz to 1GHz was investigated using a peak detector function with the bilog antenna at several heights, horizontal and vertical polarization, and with several different orientations of the EUT with respect to the antenna. The frequency range from 1GHz to 10GHz was investigated using a peak detector function with the double ridged waveguide antenna at several heights, horizontal and vertical polarization, and with several different orientations of the EUT with respect to the antenna. The maximum levels for each antenna polarization were plotted.

Final radiated emissions were performed on all significant broadband and narrowband emissions found in the exploratory sweeps using the following methods:

- 1) Measurements from 30MHz to 1GHz were made using a quasi-peak detector and a broadband bilog antenna. Measurements above 1GHz were made using an average detector and a broadband double ridged waveguide antenna.
- 2) To ensure that maximum or worst case, emission levels were measured, the following steps were taken:
 - a) The EUT was rotated so that all sides were exposed to the receiving antenna.
 - b) Since the measuring antenna is linearly polarized, both horizontal and vertical field components were measured.
 - c) The measuring antenna was raised and lowered from 1 to 4 meters for each antenna polarization to maximize the readings.
 - d) For hand-held or body-worn devices, the EUT was rotated through three orthogonal axes to determine which orientation produces the highest emission relative to the limit.

Test Setup for Radiated Emissions: 30MHz to 1GHz, Horizontal Polarization

Test Setup for Radiated Emissions: 30MHz to 1GHz, Vertical Polarization

Test Setup for Radiated Emissions: Above 1GHz, Horizontal Polarization

Test Setup for Radiated Emissions: Above 1GHz, Vertical Polarization

FCC Part 15B Class B Radiated RF Emissions Test

SW ID/Rev: VBV2 01/02/2019

Manufacturer : Springs Window Fashions
Model : RSZ2
DUT Mode : Receiving and Motor Running
Turntable Step Angle (°): 45
Mast Positions (cm) : 120, 200, 340
Ant. Polarization(s) : V
Scan Type : Stepped Scan
Test RBW : 120 kHz
Prelim Dwell Time (s) : 0.0001
Notes : N/A
Test Engineer : J. Cardenas
Test Date : Mar 12, 2020 08:31:33 AM

19. Occupied Bandwidth

Manufacturer	Springs Window Fashions
Product	Automated Window Shades
Model	RSZ2
Serial No	N/A
Mode	Transmitting

Information	
Setup Format	Tabletop
Height of Support	N/A
Type of Test Site	Semi-Anechoic Chamber
Notes	

Measurement Uncertainty	
Measurement Type	Expanded Measurement Uncertainty
Radiated disturbance (electric field strength on an open area test site or alternative test site) (30 MHz – 1000 MHz)	4.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (1 GHz – 6 GHz)	3.1
Radiated disturbance (electric field strength on an open area test site or alternative test site) (6 GHz – 18 GHz)	3.2
Radiated disturbance (electric field strength on an open area test site or alternative test site) (18 GHz – 26.5 GHz)	3.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (26.5 GHz – 40 GHz)	3.4

Procedures
The EUT was allowed to transmit continuously. The transmit channel was set separately to 908.4MHz and 916MHz. The resolution bandwidth (RBW) was set to 1% to 5% of the OCC and the span was set to greater than the RBW and wide enough to show the whole transmitter envelope. The 'Max-Hold' function was engaged. The analyzer was allowed to scan until the envelope of the transmitter bandwidth was defined. The analyzer's display was plotted using a 'screen dump' utility

Date: 13.MAR.2020 13:22:25

Date: 13.MAR.2020 13:26:30

20. Field Strength and Radiated Spurious Emissions

Manufacturer	Springs Window Fashions
Product	Automated Window Shades
Model	RSZ2
Serial No	N/A
Mode	Receiving and Motor Running

Information	
Setup Format	Tabletop
Height of Support	N/A
Type of Test Site	Semi-Anechoic Chamber
Type of Antennas Used	Below 1GHz: Bilog (or equivalent) Above 1GHz: Double-ridged waveguide (or equivalent)
Highest Internal Frequency of the EUT:	916MHz
Highest Measurement Frequency:	10GHz
Notes	The cables were manually maximized during the preliminary emissions sweeps. The cable arrangement which resulted in the worst-case emissions was utilized.

Measurement Uncertainty	
Measurement Type	Expanded Measurement Uncertainty
Radiated disturbance (electric field strength on an open area test site or alternative test site) (30 MHz – 1000 MHz)	4.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (1 GHz – 6 GHz)	3.1
Radiated disturbance (electric field strength on an open area test site or alternative test site) (6 GHz – 18 GHz)	3.2
Radiated disturbance (electric field strength on an open area test site or alternative test site) (18 GHz – 26.5 GHz)	3.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (26.5 GHz – 40 GHz)	3.4

Procedures
The EUT and all peripheral equipment were placed on an 80cm high non-conductive stand. The broadband measuring antenna was positioned at a 3 meter distance from the EUT. The frequency range from 30MHz to 1GHz was investigated using a peak detector function with the bilog antenna at several heights, horizontal and vertical polarization, and with several different orientations of the EUT with respect to the antenna. The EUT and all peripheral equipment were then placed on a 150cm high non-conductive stand. The frequency range from 1GHz to 10GHz was investigated using a peak and average detector function with the double ridged waveguide antenna at several heights, horizontal and vertical polarization, and with several different orientations of the EUT with respect to the antenna. The maximum levels for each antenna polarization were recorded.

Test Setup for Radiated Emissions: 30MHz to 1GHz, Horizontal Polarization

Test Setup for Radiated Emissions: 30MHz to 1GHz, Vertical Polarization

Test Setup for Radiated Emissions: Above 1GHz, Horizontal Polarization

Test Setup for Radiated Emissions: Above 1GHz, Vertical Polarization

21. Band-Edge Compliance

Manufacturer	Springs Window Fashions
Product	Automated Window Shades
Model	RSZ2
Serial No	N/A
Mode	Transmitting

Information	
Setup Format	Tabletop
Height of Support	N/A
Type of Antennas Used	Below 1GHz: Bilog (or equivalent) Above 1GHz: Double-ridged waveguide (or equivalent)
Notes	

Measurement Uncertainty	
Measurement Type	Expanded Measurement Uncertainty
Radiated disturbance (electric field strength on an open area test site or alternative test site) (30 MHz – 1000 MHz)	4.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (1 GHz – 6 GHz)	3.1
Radiated disturbance (electric field strength on an open area test site or alternative test site) (6 GHz – 18 GHz)	3.2
Radiated disturbance (electric field strength on an open area test site or alternative test site) (18 GHz – 26.5 GHz)	3.3
Radiated disturbance (electric field strength on an open area test site or alternative test site) (26.5 GHz – 40 GHz)	3.4

Procedures
The EUT was set to transmit continuously at 908.4MHz and 916MHz separately. To determine the band edge compliance, the following spectrum analyzer settings were used: - Center frequency = frequency at which the high and low band-edge can be seen. - Span = Wide enough to capture the peak level of the emission operating on the channel, as well as any modulation products which fall outside of the authorized band of operation. - Resolution bandwidth (RBW) $\geq$ 100kHz. - The 'Max-Hold' function was engaged. The analyzer was allowed to scan until the envelope of the transmitter bandwidth was defined. - The marker was set on the peak of the in-band emissions. A horizontal display line was placed on where the general limit lies. Two vertical displays lines were placed at 902MHz and 928MHz, the band of operation. All emissions which fall outside of the authorized band of operation must be below the general limit display line. - The analyzer's display was plotted using a 'screen dump' utility.

Date: 13.MAR.2020 13:31:53

The maximum field strength reading at 908.4MHz = 92.6dBuV/m. The limit at the band edges must be 46dBuV/m (the general limit). Therefore the emissions at the band edges must be 46.6 dB down from the fundamental. The adjusted band edge limit is based on the maximum meter reading of 77.5BuV/m. Therefore the band edge limit = 77.5dBuV – 46.6dBuV = 30.9dBuV.

Band edge measurements were taken with a near field probe antenna.

Date: 13.MAR.2020 12:09:30

The maximum field strength reading at 916MHz = 93.9dBuV/m. The limit at the band edges must be 46dBuV/m (the general limit). Therefore the emissions at the band edges must be 47.9 dB down from the fundamental. The adjusted band edge limit is based on the maximum meter reading of 65.7BuV/m. Therefore the band edge limit = 65.7dBuV – 47.9dBuV = 17.8dBuV.

22. Scope of Accreditation

SCOPE OF ACCREDITATION TO ISO/IEC 17025:2017

ELECTRICAL

Valid to: June 30, 2021

Certificate Number: 1786.01

In recognition of the successful completion of the A2LA Accreditation Program evaluation process, accreditation is granted to this laboratory to perform the following automotive electromagnetic compatibility and other electrical tests:

Test Technology:**Test Method(s) ¹:*****Transient Immunity***

ISO 7637-2 (including emissions); ISO 7637-3;
ISO 16750-2:2012, Sections 4.6.3 and 4.6.4;
CS-11979, Section 6.4; CS.00054, Section 5.9;
EMC-CS-2009.1 (CI220); FMC1278 (CI220, CI221, CI222);
GMW 3097, Section 3.5;
SAE J1113-11; SAE J1113-12

Electrostatic Discharge (ESD)

ISO 10605 (2001, 2008);
CS-11979 Section 7.0; CS.00054, Section 5.10;
EMC-CS-2009.1 (CI 280); FMC1278 (CI280); SAE J1113-13;
GMW 3097 Section 3.6

Conducted Emissions

CISPR 25 (2002, 2008), Sections 6.2 and 6.3;
CISPR 25 (2016), Sections 6.3 and 6.4;
CS-11979, Section 5.1; CS.00054, Sections 5.6.1 and 5.6.2;
GMW 3097, Section 3.3.2;
EMC-CS-2009.1 (CE 420); FMC1278 (CE420, CE421)

Radiated Emissions Anechoic

CISPR 25 (2002, 2008), Section 6.4;
CISPR 25 (2016), Section 6.5;
CS-11979, Section 5.3; CS.00054, Section 5.6.3;
GMW 3097, Section 3.3.1;
EMC-CS-2009.1 (RE 310); FMC1278 (RE310)

Vehicle Radiated Emissions

CISPR 12; ICES-002

(A2LA Cert. No. 1786.01) Revised 01/10/2020
