Project Number: 3374150

Report Number: 3374150EMC02

Revision Level: 1

Client: Medicalgorithmics

Equipment Under Test: Mobile Computer

Model Name: PocketECG transmitter

Model Number: PocketECG III

Hardware Version: R904

Software Version 10.001-6.000-8287

Applicable Standards: FCC Part 15 Subpart C, § 15.247

RSS-210, Issue 8, December 2010

ANSI C63.10: 2009

Report issued on: 14OCT2014

Test Result: Compliant

Tested by:

Remarks:

This report details the results of the testing carried out on one sample, the results contained in this test report do not relate to other samples of the same product. The manufacturer should ensure that all products in series production are in conformity with the product sample detailed in this report.

This report may only be reproduced and distributed in full. If the product in this report is used in any configuration other than that detailed in the report, the manufacturer must ensure the new system complies with all relevant standards. Any mention of SGS International Electrical Approvals or Testing done by SGS International Electrical Approvals in connection with distribution or use of the product described in this report must be approved by SGS international Electrical Approvals in writing.

Frequency Range: 2412 to 2462 MHz
5745 to 5825 MHz
Modulation type: CCK, DBPSK, DQPSK
BPSK, QPSK, 16QAM, 64QAM
Channel spacing: 20 MHz
Antenna: Integral
Rated Voltage: 3.7 VDC Internal Battery

Sample Received Date: 10 DEC 2013
Dates of testing: 16 JAN – 26 MAR 2014

Operating Modes and Conditions

Modulations used: For fundamental and spurious measurements, the EUT was configured to operate continuously with Wi-Fi modulation enabled.

As specified in Section 5.10.5 of ANSI C63.10:2009:

- The software allowed configuration and operation on all available unlicensed wireless device channels.
- The software allowed configuration and operation using all available modulations and data rates
- The software allowed configuration and operation on all available power out levels

5 Radiated Spurious Emissions

5.1 Test Result

Test Description	Test Specification	Test Result
Radiated Spurious Emissions	15.247(d) and 15.209(a)	Compliant

5.2 Test Method

The test data was measured using a spectrum analyzer with

- Peak detector, max hold
- Resolution bandwidth of at least 100 kHz
- Video bandwidth at least 3x RBW
- Frequency range: 30 MHz to 40 GHz

The initial preliminary exploratory scans were performed over the frequency range as indicated in the tables below using the max hold function and incorporating a Peak detector and using TILE! software. The final test data was measured using a Quasi-Peak detector below 1GHz and a Peak detector above 1GHz. For harmonics of the fundamental, For emissions other than harmonics of the fundamental, the Average measurements were made using the Average detector. The receivers resolution bandwidth was set to 120 kHz for measurements taken in the 30MHz to 1GHz frequency range and 1MHz for measurements for 1GHz and higher. Measurements were made with the antenna positioned in both the horizontal and vertical planes of polarization. The antenna height was varied from 1 m to 4 m and the EUT was rotated 360° to find the maximum emitting point for each frequency. The radiated measurements were recorded and compared to the limits indicated in the table below.

Test distance:

30 MHz to 1 GHz - The EUT to measurement antenna distance is 3 meters

1 to 18 GHz - The EUT to measurement antenna distance is 2 meters

18 to 40 GHz - The EUT to measurement antenna distance is 1/2 meter

The limit in any 100 kHz bandwidth is 30 dB below the measured peak power in any 100 kHz Bandwidth or the 15.209(a) field strength limits; whichever is greater.

7.2 Test Method

Peak and average field strength measurements were performed at the restricted band edges of 2390MHz and 2483.5MHz. Measurements were made using the conducted methods defined in Section 12 of FCC publication D01 DTS Meas Guidance v03r01. The measurements were recorded and using the equation $E = \text{EIRP} - 20\log D + 104.8$, the readings were converted to a radiated field strength equivalent. The resultant data were compared to the average limit of 54 dBμV/m and peak limit of 74 dBμV/m.

All 2.4 and 5GHz emissions were measured and shown that the 30dB occupied bandwidth is contained within the allowed frequency range as measured in a 100 kHz resolution bandwidth.

Measurements were made in the following modes of operation: 802.11b,g and n at low and high channels. The worst-case data rates of 6Mbit/s and MCS0,7 were used.
