6845		26.52			18.01	-17.43	33.92	34.71

Note 1: DUT will transmit on four of the available channels that have the highest allowed power based on the response from the AFC system. During testing, four channels were validated to ensure that the EIRP power for each channel does not exceed the allowed power from the AFC, i.e., AFC EIRP Limit on the table above.

Note 2: UNII-5 Antenna Gain = 14.9dBi.

The device is driving cross-polarized antenna, which has 4 horizontal polarization antenna and 4 vertical polarization antenna. Directional Gain (4H/4V) = 14.9dBi + 10log(Ntx = 4 / Nss = 2) = 17.91dBi

Note 3: UNII-7 Antenna Gain = 15dBi.

The device is driving cross-polarized antenna, which has 4 horizontal polarization antenna and 4 vertical polarization antenna. Directional Gain (4H/4V) = 15dBi + 10log(Ntx = 4 / Nss = 2) = 18.01dBi

Note 4: Conducted power were measured on sum of 4 horizontal polarization output ports. MIMO factor 3.01 is considered to calculate total conducted output power.

Note 5: The path loss between the DUT and the Spectrum Analyzer has been offset and configured in the Spectrum Analyzer.

Note 6: The duty cycle factor, calculated as 10log(1/duty cycle) and listed in the table above, is used to compute the average power during continuous transmission.

Note 1: DUT will transmit on four of the available channels that have the highest allowed power based on the response from the AFC system. During testing, four channels were validated to ensure that the EIRP power for each channel does not exceed the allowed power from the AFC, i.e., AFC EIRP Limit on the table above.

Note 2: UNII-5 Antenna Gain = 14.9dBi.

The device is driving cross-polarized antenna, which has 4 horizontal polarization antenna and 4 vertical polarization antenna. Directional Gain (4H/4V) = 14.9dBi + 10log(Ntx = 4 / Nss = 2) = 17.91dBi

Note 3: UNII-7 Antenna Gain = 15dBi.

The device is driving cross-polarized antenna, which has 4 horizontal polarization antenna and 4 vertical polarization antenna. Directional Gain (4H/4V) = 15dBi + 10log(Ntx = 4 / Nss = 2) = 18.01dBi

Note 4: Conducted power were measured on sum of 4 horizontal polarization output ports. MIMO factor 3.01 is considered to calculate total conducted output power.

Note 5: The path loss between the DUT and the Spectrum Analyzer has been offset and configured in the Spectrum Analyzer.

Note 6: The duty cycle factor, calculated as 10log(1/duty cycle) and listed in the table above, is used to compute the average power during continuous transmission.
