Equipment Under Test (EUT):

ScanMonkey

Test Commissioned by:

ZHC Systems Ltd
20 Panton Street
Cambridge
Cambridgeshire
CB2 1HP

Representative:

Alun Jones

Test Started:

21st October 2013

Test Completed:

20th December 2013

Test Engineer:

Stephen Browning

Date of Report:

28th January 2014

Written by: Stephen Browning

Checked by: Dave Smith

Signature:

Signature:

Date: 28th January 2014

Date: 28th January 2014

dB Technology can only report on the specific unit(s) tested at its site. The responsibility for extrapolating this data to a product line lies solely with the manufacturer.

Test Standards Applied

**CFR 47
Class B**

*Code of Federal Regulations: Pt 15 Subpart B- Radio Frequency Devices -
Unintentional Radiators*

1 EUT Details

1.1 General

The EUT was an adaptor for single key or sensor data entry in place of a keyboard. The EUT had a metal enclosure and was designed to be powered from the pc via USB.

It is designed mainly to be used in office or domestic environments and it included microprocessor circuitry with a maximum frequency of 48MHz.

Details of the EUT and associated peripherals used during the tests are listed below. Figure 1 shows the interconnections between the EUT and peripherals.

Item	Manufacturer	Model	Description	Serial No:	Notes
1	ZHC	Scan_Monkey	EUT	-	
2	Toby Churchill		Push button control.	-	#1
3	Toshiba	T130-11H	Laptop pc.	X9110012W	DoC
4	Toshiba	PA3714E-1AC3	PSU for Laptop	-	#2
5	D-Link	DES-1005D	Ethernet Switch	7000980	DoC
6	D-Link	AD-071AD	ac adaptor	-	#2

#1 This was a mechanical switch assembly only.

#2 PSU so FCC ID or DoC not required.

The manufacturer has a number of variants based on this unit which use the same hardware but turn off/on the LEDs to suit the product:

- o ScanMonkey: for Computer
- o KeyboardMonkey: for Computer
- o ScanMonkey: for Android
- o KeyboardMonkey: for Android
- o ScanMonkey: for Mac
- o KeyboardMonkey: for Mac

	Report No: R3301 Issue No: 2	FCC ID:2ABPQ-ZHC	
	Test No: T5172	Test Report	Page: 6 of 19

1.2 Modifications to EUT and Peripherals

Details of any modifications that were required to achieve compliance are listed below. The modification numbers are referred to in the results sections as appropriate.

Mod No:	Details	Implemented for
0	As received on 19th December 2013 with metalised end panels plus copper tape applied to aperture for USB connector.	

1.3 EUT Operating Modes

The EUT was tested in the following operating mode or modes. Generally, operating modes are chosen that will exercise the functions of the EUT as fully as possible and in a manner likely to produce maximum emission levels or susceptibility. Individual test result sheets reference the operating mode of the EUT.

Operating Mode	Details
1	Scanning switch and displaying alphabetical sequence of letters continuously. Powered by USB.

Figure 1 General Arrangement of EUT and Peripherals

	Description	Type	Length	Notes

3 Test Methods

3.1 Conducted Emissions - ac power

Bench top EUTs and peripheral equipment are normally placed on a 0.8m high non-conducting bench, positioned 0.4m from one of the metallic walls of a screened room. Floor standing EUTs are normally placed 0.1m above the metallic floor of the screened room. Mains leads are bundled so as not to exceed 1m.

The EUT is powered using a 50ohm/50uH Line Impedance Stabilisation Network (LISN). Peripherals are powered using a second a 50ohm/50uH LISN. These LISNs are bonded to the screened room floor.

With the correct supply voltage applied to the EUT scans are performed on both the live and neutral line outputs of the LISN using quasi-peak detection over the specified frequency range. The results of these scans are shown in the plots section at the end of the report.

Significant emissions identified by the scans are measured and the results tabulated. The table of results is shown in the conducted emissions results section.

Final Level (dBuV) = Receiver Reading (dBuV) + Combined Cable and Attenuation Correction Factor (dB)

Example: if, @191kHz, receiver reading was 35.8dBuV

Final level = 35.8 + 10.0 = 45.8 dBuV

3.2 Radiated Emissions

Initial scans are performed in a semi-anechoic screened room at a distance of 3m. Scans are performed over the frequency range specified in the test standard with the antenna both horizontally and vertically polarised. During these scans the EUT and peripherals are rotated through 360°. Bench top EUTs are placed on a non-conducting bench at a height of 0.8m above the ground plane. Floor standing EUTs are placed 0.1m above the ground plane. The EUT cables were manipulated in an attempt to produce maximum emissions. The results of the scans are shown in the plots included at the end of the report.

Significant emissions identified by the scans are measured on an open area test site at the appropriate test distance using a CISPR16 quasi-peak receiver. Maximised readings are obtained by rotating the EUT through 360° and adjusting the height of the antenna from 1m to 4m. Measurements are made with the antenna both horizontally and vertically polarised and the results tabulated.

Tabulated results show levels based on the following calculation:

Field Strength (dBuV) = receiver reading (dBuV) + CF (dB/m).

CF is the correction factor for the antenna and the cable.

For example: if, at 114MHz, receiver reading was 17.9dBuV, combined correction factor = 13.1 (dB/m).

Total field strength = 17.9 + 13.1 = 31.0 dBuV/m

Where a narrow band measurement has been taken an additional correction factor is included.

4 Test Results

The following sections contain tabulated test results. Plots of various scans are included at the back of this section.
