

EMISSIONS TEST REPORT

Report Number: 101812529BOX-012a

Project Number: G101812529

Report Issue Date: 01/27/2015

Product Designation: Model C

Standards: FCC 47CFR PT 90 Subpart F (2015): Private Land Mobile Radio Services

Tested by:
Intertek Testing Services NA, Inc.
70 Codman Hill Road
Boxborough, MA 01719
USA

Client:
Laufer Wind
10 Commerce Park North, Unit 12
Bedford, NH 03110
USA

Report prepared by

Vathana Ven / Staff Engineer, EMC

Report reviewed by

Michael Murphy / Sr. Staff Engineer, EMC

This report is for the exclusive use of Intertek's Client and is provided pursuant to the agreement between Intertek and its Client. Intertek's responsibility and liability are limited to the terms and conditions of the agreement. Intertek assumes no liability to any party, other than to the Client in accordance with the agreement, for any loss, expense or damage occasioned by the use of this report. Only the Client is authorized to permit copying or distribution of this report and then only in its entirety. Any use of the Intertek name or one of its marks for the sale or advertisement of the tested material, product or service must first be approved in writing by Intertek. The observations and test results in this report are relevant only to the sample tested. This report by itself does not imply that the material, product, or service is or has ever been under an Intertek certification program.

1 Introduction and Conclusion

The tests indicated in section 2.0 were performed on the product constructed as described in section 4.0. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test Method, a list of the actual Test Equipment Used, documentation Photos, Results and raw Data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested **complies** with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested.

2 Test Summary

Section	Test full name	Result
3	Client Information	--
4	Description of Equipment Under Test	--
5	System Setup and Method	--
6	Power (CFR47 FCC Part 90.205)	No Limit
7	Bandwidth (CFR47 FCC Part 90.209)	No Limit
8	Emissions Mask (CFR47 FCC Part 90.210)	Pass
9	Radiated Spurious Emissions (CFR47 FCC Part 90.210)	Pass
10	AC Mains Conducted Emissions (CFR47 FCC Part 15.207)	Pass
11	Frequency Stability (CFR47 FCC Part 90.213)	No Limit
12	Revision History	--

3 Client Information

This EUT was tested at the request of:

Company: Laufer Wind
10 Commerce Park North, Unit 12
Bedford, NH 03110 USA

Contact: Rod Petr
Telephone: (603) 232-0226 ext. 313
Fax: (603) 232-0337
Email: rpetr@lauferwind.com

4 Description of Equipment Under Test

Equipment Under Test			
Description	Manufacturer	Model Number	Serial Number
Aircraft Detection Sight Solution Doppler Radar System	Eric Laufer, dba Laufer Wind Group LLC	Model C	91-10001-002

Receive Date:	10/21/2014, 01/15/2015
Received Condition:	Good
Type:	Production

Description of Equipment Under Test (provided by client)
The EUT is an Aircraft Detection Sight Solution Doppler Radar System

Equipment Under Test Power Configuration			
Rated Voltage	Rated Current	Rated Frequency	Number of Phases
100-240 VAC	550 VA / 500 W (Max)	50 / 60 Hz	Single w/ Ground

Operating modes of the EUT:

No.	Descriptions of EUT Exercising
1	Transmitting at full power, 9.4 GHz nominal (X-Band)

Software used by the EUT:

No.	Descriptions of EUT Exercising
1	Central Controller: 1.0.3927

6 Power

6.1 Method

Tests are performed in accordance with FCC CFR47 Part 90, and using the guidance of FCC Public Notice DA:04-3946, Agilent Application Note 150-2, and ANSI C63.10:2009 Annex C.

TEST SITE: Immunity

6.2 Test Equipment Used:

6.5 Plots/Data:

Pulse Characteristics

PRF: 2 kHz

Pulse Width: 500 ns

To obtain the true peak value of the emission, a Resolution Bandwidth of 200 Hz, which was equal to $0.1 * \text{PRF}$ was used to obtain a line spectrum of the pulsed emission. Once the line spectrum was obtained, the maximum value, 10.33 dBm, was recorded and is shown in the plot below. This value was obtained using a 20 dB offset for the attenuator pad, which was subsequently verified and found to be 21.74 dB at the fundamental. Coupler and cable attenuation were programmed into the spectrum analyzer. A pulse desensitization factor was then calculated based on the following equation:

$\text{PDCF} = 20 * \text{LOG}(\text{PW}/\text{T})$ where PW is the pulse width in seconds, and T is the period in seconds, obtained by taking the inverse of the PRF. The calculated PDCF was therefore 60 dB.

Final Peak Output Power is therefore: 6.27 dBm + 60 dB = 66.27 dBm (4.326 kW)

Average Power: Peak Output Power – Average Factor, where calculated average factor equal to $10 * \log(\text{duty cycle})$ or 30 dB.

Average Power: 66.27 dBm – 30 dB = 36.27 dBm (4.326 Watts)

Emissions Mask C, 80 MHz Span (250% bandwidth), Referenced to 66.3 dBm Output Power, 2 kHz RBW used for plot generation purposes, compliance is still demonstrated

Test Personnel: Vathana Ven
 Supervising/Reviewing Engineer:
 (Where Applicable) N/A
 Product Standard: Part 90 Subpart F
 Input Voltage: 120V/60Hz
 Pretest Verification w/ Ambient Signals or BB Source: Yes

Test Date: 11/20/2014
 Limit Applied: No limit, case by case authorization
 Ambient Temperature: 24 °C
 Relative Humidity: 54 %

Notes: The plot does not include the 30 dB for average factor adjustment. The plot would be shifted by 30 dB for an average result.

Deviations, Additions, or Exclusions: None

9 Radiated Emissions

9.1 Method

Tests are performed in accordance with Tests are performed in accordance with Part 90 Subpart F, and ANSI C63.4:2009.

TEST SITE: 10m ALSE

The 10m ALSE is 13m (Length) x 21m (Depth) x 10m (Height) with the effective size in terms of space from the tips of the absorber is 12m (Length) x 20m (Depth) x 8.5m (Height). This chamber achieves broadband performance using a unique arrangement of hybrid and ferrite tile absorber. This chamber has a built in 3m diameter turntable (Embedded type). The metal structure of the table makes electrical connection around the entire circumference of the turntable to the ground plane with a metal brush type connection. The turntable is located on one end of the chamber and the antennas are mounted 3 and 10 meters away at the other end of the chamber on the adjustable an Antenna Mast. The antenna mast is a non-conductive bore sighted type with remote control of antenna height and polarization. The Antenna Mast and the turntable can be remotely controlled through the controller located in the adjacent Control room. A Styrofoam table 80 cm high is used for table-top equipment.

Measurement Uncertainty

For radiated emissions, U_{lab} (3.5 dB at 3m and 3.5 dB at 10m below 1 GHz, and 4.2 dB at 3m above 1 GHz) $< U_{CISPR}$ (5.2 dB), which is the reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required, based on CISPR 22 and CISPR 11 (for 2006 and later revisions) Clause 11.

Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

Where

- FS = Field Strength in dB μ V/m
- RA = Receiver Amplitude (including preamplifier) in dB μ V
- CF = Cable Attenuation Factor in dB
- AF = Antenna Factor in dB
- AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB μ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB μ V/m. This value in dB μ V/m was converted to its corresponding level in μ V/m.

RA = 52.0 dB μ V
 AF = 7.4 dB/m
 CF = 1.6 dB
 AG = 29.0 dB
 FS = 32 dB μ V/m

To convert from dB μ V to μ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

NF = Net Reading in dB μ V

Example:

$$FS = RA + AF + CF - AG = 52.0 + 7.4 + 1.6 - 29.0 = 32.0$$

$$UF = 10^{(32 \text{ dB}\mu\text{V} / 20)} = 39.8 \mu\text{V/m}$$

10 AC Mains Conducted Emissions

10.1 Method

Tests are performed in accordance with FCC Part 15 Subpart C 15.207 and ANSI C63.4:2009.

TEST SITE: EMC Lab

The EMC Lab has two Semi-anechoic Chambers and one Shielded Chamber. AC Mains Power is available at 120, 230, and 277 Single Phase; 208, 400, and 480 3-Phase. Large reference ground-planes are installed in the general lab area to facilitate EMC work not requiring a shielded environment.

The AMAP Building and Lab includes general lab space that can be used for testing where a shielded/enclosed environment is not required.

Measurement Uncertainty

For conducted emissions, U_{lab} (3.1 dB in worst case) $< U_{CISPR}$ (3.6 dB), which is the reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required, based on CISPR 22 and CISPR 11 (for 2006 and later revisions) Clause 11.

Sample Calculations

The following is how net line-conducted readings were determined:

$$NF = RF + LF + CF + AF$$

Where NF = Net Reading in dB μ V

RF = Reading from receiver in dB μ V

LF = LISN or ISN Correction Factor in dB

CF = Cable Correction Factor in dB

AF = Attenuator Loss Factor in dB

To convert from dB μ V to μ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

NF = Net Reading in dB μ V

Example:

$$NF = RF + LF + CF + AF = 28.5 + 0.2 + 0.4 + 20.0 = 49.1 \text{ dB}\mu\text{V}$$

$$UF = 10^{(49.1 \text{ dB}\mu\text{V} / 20)} = 285.1 \mu\text{V/m}$$

10.2 Test Equipment Used:

Asset	Description	Manufacturer	Model	Serial	Cal Date	Cal Due

11 Frequency Stability

11.1 Method

Tests are performed in accordance with FCC 47CFR PT 90 Subpart F.

TEST SITE: Safety Lab

The EMC Lab has two Semi-anechoic Chambers and one Shielded Chamber. AC Mains Power is available at 120, 230, and 277 Single Phase; 208, 400, and 480 3-Phase. Large reference ground-planes are installed in the general lab area to facilitate EMC work not requiring a shielded environment.

The AMAP Building and Lab includes general lab space that can be used for testing where a shielded/enclosed environment is not required.
