3.9 Antenna Requirement

3.9.1 Test procedure

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

3.9.2 Test result

The antennas of the VBar Control 2.4 GHz FHSS Satellite Receiver permanently attached and there are no provisions for connection to an external antenna. It complies with the requirement of §15.203.

3.10 RF exposure

3.10.1 General

This test was performed to determine the minimum safe distance between the transmitter antenna and human to avoid public exposure in excess of limits for general population (uncontrolled exposure). Specification test limits are given in Table 3.10.1.

Table 3.10.1 — Limits For Maximum Permissible Exposure (MPE)

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
(A) Limits for Occupational/Controlled Exposure				
0.3-3.0	614	1.63	*100	6
3.0-30	1842/f	4.89/f	*900/f ²	6
30-300	61.4	0.163	1.0	6
300-1,500	-	-	f/300	6

(B) Limits for General Population/Uncontrolled Exposure				
0.3-1.34	614	1.63	*100	30
1.34-30	824/f	2.19/f	*180/f ²	30

300-1,500	-	-	f/1500	30
1,500-100,000	-	-	1.0	30

f = frequency in MHz * = Plane-wave equivalent power density

3.10.2 Test procedure: 47 CFR, §1.1307(b)(1).

3.10.3 Power density calculation for mobile transmitter

The power density at the specified distance was calculated from the following equation:

$$S = \frac{PG}{4\pi R^2},$$

where

S = power density (mW/cm²)

P = average power input to the antenna over averaging time (mW)

G = power gain of the antenna in the direction of interest relative to an isotropic radiator (numeric)

R = distance to the center of radiation of the antenna (cm)

Power density calculation for duty cycle 20 %:

$$S = \frac{0.2 \times 99 \times 1.58}{4 \times \pi \times 20^2} = 0.0062 \text{ [mW/cm}^2\text{]}$$

Frequency range, MHz	Maximum output power, dBm	Antenna gain, dBi	EIRP		Power density, mW/m ²	Limit, mW/cm ²	Margin, mW/cm ²	Verdict
			dBm	mW				
2.400 - 2.4835	18	2	20	100	0.0062	1.0	0.9938	Pass

The equipment is intended for use at a distance of more than 20 cm from humans.
