Date de l'essai : Du 14 au 27 septembre 2016
Date of test: September 14th to 27th, 2016

Objectif des essais : EMC qualification accordingly to following standards:
Test purpose: - CFR 47, FCC Part 15, Subpart B & C
(Chapter 15.247 - Operation within the bands 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz)
- Industry Canada ICES-003 Issue 6, RSS-Gen Issue 4 & RSS-247, Issue 1
(Digital Transmission Systems)

FCC ID: 2ABZ40003
IC ID : 11833A-0003
Model : Routeur V3

Lieu du test: SMEE CE-Mesures
Test location: 38 VOIRON - France

Test réalisé par : Jérémy BLANCHER
Test realized by:

Conclusion : L'équipement satisfait aux prescriptions des normes citées en référence.
Conclusion: The appliance complies with requirements of above mentioned standards.

EUT is wired to the ADAPTER ancillary with RJ45 cable at its RJ45 input port.
RJ45 output port is wired to ROUTEUR ancillary.
RJ45 ports are composed by two pairs for 24Vdc power and two pairs for RS422 link.
AC mains voltage is converted into 24Vdc to power RJ45 output ports.
A 24Ω load is wired at output port (1A).
The tested sample is able to:

- Transmit a carrier frequency on low, middle and high channels (903.5MHz / 914.5MHz / 926.5MHz)
- Communicate with ancillary equipment (wired link with ADAPTER or RF link with PLASTRON)
- Be in Receiver mode (no transmission)
- Be in Standby mode

7. Conducted Emission Measurement (150kHz-30MHz)

TEST: Limits for conducted disturbance 150kHz – 30MHz				Verdict
Method: The LISN is placed 0,8 m from the boundary of the unit under test and bonded to a ground reference plane. This distance was between the closest points of the AMN and the EUT. All other units of the EUT and associated equipment were at least 0,8 m from the AMN. All power was connected to the system through Artificial Mains Network (AMN). Conducted voltage measurements on lines were made at the output of the LISN. The EUT is 80cm above the ground reference plane and 40cm from the vertical ground plane. The AC power cable is 1m length.				Pass

8. Radiated Emission Measurement (30MHz-9.3GHz)

TEST: Limits for radiated disturbance 30 MHz – 9.3 GHz			Verdict
<u>Method:</u> Measurements were made in a 3-meter Open Area Test Site (OATS) that complies to ANSI C63.4. Preliminary (peak) measurements were performed at an antenna to EUT separation distance of 3 meters. The EUT was rotated 360° about its azimuth with the receive antenna located at various heights in horizontal and vertical polarities. Final measurements (Peak, Quasi-peak) were then performed by rotating the EUT 360° and adjusting the receive antenna height from 1 to 4 m. All frequencies were investigated in both horizontal and vertical antenna polarity, where applicable. A pre-scan frequency identification of the EUT has been performed in full anechoic chamber. The measured radiated field of the EUT is realised at 3-meters of distance. Antenna is 1.25-meters high. The pre-characterization graphs are obtained in PEAK detection.			Pass

Method: RF Output of EUT is wired directly to a spectrum analyser. A conducted measurement is performed. The RBW is 1MHz (> DTS Bandwidth), with VBW ≥ 3 x RBW. The SPAN is wide enough to capture all products of the modulation process. A MaxHold Peak detector is used. Radiated field strength of RF Output Power is measured at 3m on Open Area Test Site The tested equipment is set to transmit operation with modulations on lowest, middle and highest channel		Pass

12. Unwanted emissions in Non-Restricted Frequency bands

TEST: Unwanted emissions in Non-Restricted Frequency Bands			Verdict
<u>Method:</u> Measurements were made in a 3-meter Open Area Test Site (OATS) that complies to ANSI C63.4. Preliminary (peak) measurements were performed at an antenna to EUT separation distance of 3 meter. The EUT was rotated 360° about its azimuth with the receive antenna located at various heights in horizontal and vertical polarities. Final measurements (Peak) were then performed by rotating the EUT 360° and adjusting the receive antenna height from 1 to 4 m. All frequencies were investigated in both horizontal and vertical antenna polarity, where applicable. A pre-scan frequency identification of the EUT has been performed in full anechoic chamber. The measured radiated field of the EUT is realised at 3-meters of distance. Antenna is 1.25-meters high.			Pass

14. Occupied bandwidth (99%)

TEST: Occupied bandwidth (99%) / RSS-GEN			Verdict
<u>Method:</u> RF Output of EUT is wired directly to a spectrum analyser. A conducted measurement is performed. The RBW is set in the range of 1% to 5% of the occupied bandwidth, with VBW ≥ 3 x RBW. The SPAN is wide enough to capture all products of the modulation process. A MaxHold Peak detector is used. Measure is performed with OBW 99% function of the spectrum analyser. The tested equipment is set to transmit operation with modulations on lowest, middle and highest channel.			Pass
