Report Scope

This report addresses the EMC verification testing and test results of the Muse model: **MU-03** from Interaxon Inc. This unit is herein referred to as EUT (Equipment Under Test). The EUT was tested for compliance against the following standards:

RSS-247 Issue 2:2017

FCC Part 15 Subpart C 15.247:2017

Test procedures, results, justifications, and engineering considerations, if any, follow later in this report.

This report does not imply product endorsement by any government, accreditation agency, or TÜV SÜD Canada Inc.

Opinions or interpretations expressed in this report, if any, are outside the scope of TÜV SÜD Canada Inc. accreditations. Any opinions expressed do not necessarily reflect the opinions of TÜV SÜD Canada Inc., unless otherwise stated.

Overall Result			Pass

^a See *Notes, Justifications, or Deviations* section for more details.

If the product as tested or otherwise complies with the specification, the EUT is deemed to comply with the requirement and is deemed a 'PASS' grade. If not 'FAIL' grade will be issued. Note that 'PASS' / 'FAIL' grade is independent of any measurement uncertainties.

Client	Interaxon Inc.	
Product	Muse MU-03	
Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Notes, Justifications, or Deviations

The following notes, justifications for tests not performed or deviations from the above listed specifications apply:

For the antenna requirement specified in FCC 15.203, the unit uses a Johanson Technology part number 2450AT18B100 ceramic chip antenna, with 0.5 dBi peak gain, permanently soldered onto the PCB.

For the Restricted Bands of operation, the EUT is designed to only operate between 2400 – 2483.5 MHz.

The EUT is not a hybrid system.

The EUT was tested positioned in the three orthogonal axis. Worst case results are presented. See *Appendix B* for test photos.

The EUT's output is set to transmit continuously at 100% duty cycle at the maximum output power.

SAR assessment is applicable to the EUT. An assessment distance of ≤ 5 mm is applied. The device meets the SAR Test exemption criteria and no test is required. See RF Exposure exhibits for more details.

The EUT is a battery operated device with a battery rechargeable via a USB port. The radio is powered off while charging. Power line conducted emissions is performed while it is recharging using a representative support device (Lenovo ThinkPad 13 with Lenovo AC/DC Adapter model ADLX45NCC2A). Other tests were performed with the battery fully charged.

Sample Calculation(s)

Radiated Emission Test

Margin = Limit – (Received Signal + Antenna Factor + Cable Loss – Pre-Amp Gain)

Margin = 50.5dB μ V/m – (50dB μ V + 10dB + 2.5dB – 20dB)

Margin = 8.0 dB (pass)

Power Line Conducted Emission Test

Margin = Limit – (Received Signal + Attenuation Factor + Cable Loss + LISN Factor)

Margin = 73.0dB μ V – (50dB μ V + 10dB + 2.5dB + 0.5dB)

Margin = 10.0 dB (pass)

Definitions and Acronyms

The following definitions and acronyms are applicable in this report.
See also ANSI C63.14.

DTS – Digital Transmission System
LISN – Line Impedance Stabilization Network
NCR – No Calibration Required
NSA – Normalized Site Attenuation
N/A – Not Applicable
RF – Radio Frequency

AE – Auxiliary Equipment. A digital accessory that feeds data into or receives data from another device (host) that in turn, controls its operation.

Antenna Port – Port, other than a broadcast receiver tuner port, for connection of an antenna used for intentional transmission and/or reception of radiated RF energy.

BW – Bandwidth. Unless otherwise stated, this refers to the 6 dB bandwidth.

EMC – Electro-Magnetic Compatibility. The ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable electromagnetic disturbances to anything in that environment.

EMI – Electro-Magnetic Immunity. The ability to maintain a specified performance when the equipment is subjected to disturbance (unwanted) signals of specified levels.

EUT – Equipment Under Test. A device or system being evaluated for compliance that is representative of a product to be marketed.

ITE – Information Technology Equipment. Has a primary function of entry, storage, display, retrieval, transmission, processing, switching, or control of data and/or telecommunication messages and which may be equipped with one or more ports typically for information transfer.

Client	Interaxon Inc.	
Product	Muse MU-03	
Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Testing Facility

Testing for EMC on the EUT was carried out at TÜV SÜD Canada labs near Toronto, Ontario. The testing lab consists of a 3m semi-anechoic chamber calibrated to be able to allow measurements on a EUT that has a maximum width or length of up to 2m and a height of up to 3m. The chamber is equipped with a turntable that is capable of testing devices up to 3300lb in weight. This facility is capable of testing products that are rated for 120Vac and 240Vac single phase, or devices that are rated for a 208Vac 3 phase input. DC capability is also available for testing. The chamber is equipped with a mast that controls the polarization and height of the antenna. Control of the mast occurs in the control room adjoining the shielded chamber. Radiated emission measurements are performed using a BiLog antenna and a Horn antenna where applicable. Conducted emissions, unless otherwise stated, are performed using a LISN and using the Vertical Ground plane if applicable.

Calibrations and Accreditations

The 3m semi-anechoic chamber is registered with Federal Communications Commission (FCC, CA6844), Industry Canada (IC, 6844A-3) and Voluntary Control Council for Interference (VCCI, R-4023, G-506, C-4498, and T-1246). This chamber was calibrated for Normalized Site Attenuation (NSA) using test procedures outlined in ANSI C63.4 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The chamber is lined with ferrite tiles and absorption cones to minimize any undesired reflections. The NSA data is kept on file at TÜV SÜD Canada. For radiated susceptibility testing, a 16 point field calibration has been performed on the chamber. The field uniformity data is kept on file at TÜV SÜD Canada. TÜV SÜD Canada Inc. is accredited to ISO 17025 by A2LA with Testing Certificate #2555.01. The laboratory's current scope of accreditation listing can be found as listed on the A2LA website. All measuring equipment is calibrated on an annual or bi-annual basis as listed for each respective test.

Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

6 dB and 99% Bandwidths

Purpose

The purpose of this test is to ensure that the bandwidth occupied exceeds a stated minimum. This helps ensure the utilization of the frequency allocation is sufficiently wide. This also helps prevent corruption of data by ensuring adequate data separation to distinguish the reception of the intended information.

Limits and Method

The limit is as specified in FCC Part 15.247(a)2, and RSS-247 5.2(a).

Systems using digital modulation techniques may operate in the 902 - 928 MHz, 2400 - 2483.5 MHz, and 5725 - 5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz. This is measured with a 100 kHz RBW and a 300 kHz VBW.

The method is given in Section 8.1 of FCC KDB 558074 and ANSI C63.10.

There is no defined requirement for the 99% occupied bandwidth. It is included for informational purposes only.

Results

The EUT passed. The minimum 6 dB BW measured was 681.1 kHz and the maximum 99% Occupied Bandwidth was 1.0577 MHz.

Channel	Frequency (MHz)	6 dB Bandwidth (MHz)	99% Bandwidth (MHz)
Low	2402	0.6811	1.0577
Mid	2440	0.6811	1.0577
High	2480	0.6972	1.0577

Client	Interaxon Inc.	
Product	Muse MU-03	
Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Graphs

The graphs showed below show the OBW during the operation of the device. This is measured by a max hold on the spectrum analyzer and the highest resolution bandwidth that is sufficiently low to exhibit the 6 dB bandwidth of a channel during operation of the EUT. Max hold is performed for a duration of not less than 1 minute.

Maximum Peak Conducted Power

Purpose

The purpose of this test is to ensure that the maximum power conducted to the radiating element does not exceed the limits specified. This ensures that if the end-user replaces the antenna, the maximum power does not exceed an amount which may create an excessive power level.

Limits and Method

The limits are defined in FCC Part 15.247(b)(3) and RSS-247 5.4(d).

For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands, the peak limit is 1 watt (or 30 dBm = 125.2 dBμV at 3m distance). The E.I.R.P. limit is 4 watts (or 36 dBm = 131.2 dBμV at 3m distance).

The method is given in Section 9.1.2 of FCC KDB 558074 and ANSI C63.10.

Results

The EUT passed. The EUT was set to transmit at maximum power. Low, Middle and High Channels were measured. The following table shows the peak power:

Test Frequency (MHz)	Channel	Measured Reading (dBm)	External Attenuator + Cable loss (dB)	Output Power (dBm)	Output Power (mW)	Output Limit (dBm)	Margin (dB)	Result
2402	Low	-10.09	10	-0.09	0.9795	30	30.09	Pass
2440	Mid	-10.08	10	-0.08	0.9817	30	30.08	Pass
2480	High	-10.06	10	-0.06	0.9863	30	30.06	Pass

Graphs

The plots shown below show the peak power output of the device during the antenna conducted measurements during transmit operation of the EUT. The measurement RBW is $\geq$ than the DTS bandwidth.

Note: 10 dB of attenuator + cable loss applicable when making measurements shown below.

Maximum Peak E.I.R.P Output

Purpose

The purpose of this test is to ensure that the maximum power output does not exceed the limits specified when used with the antenna, which may provide gain. This ensures that the maximum power does not exceed an amount which may create an excessive power level.

Limits

The limits are defined in RSS-247 5.4(d).

For DTSS operating in the 2400-2483.5 MHz band, the peak E.I.R.P. limit is 4 Watts (or 36 dBm = 131.2 dBμV at a 3m distance).

Additionally, the peak conducted output power limit is 1 Watt. The analysis of this requirement is covered in the previous section.

Results

The EUT passed. The peak E.I.R.P. is -2.72 dBm (0.535 mW, 0.000535 W, or 92.48 dBμV/m at 3 m).

Antenna Spurious Conducted Emissions (-20 dBc Requirement)

Purpose

The purpose of this test is to ensure that the maximum power conducted to the radiating element at frequencies outside of the authorized spectrum does not exceed the limits specified. This ensures that the only the intended signal is delivered to the radiating element.

Limits and Method

The limits are defined in FCC Part 15.247(d) and RSS-247 5.5. In any 100 kHz band outside the frequency band in which the intentional radiator is operating, the peak spurious harmonics emissions must be at least 20 dB below the fundamental. Spurious conducted emissions are to be evaluated up to the 10th harmonic. This -20 dBc requirement also applies at the 'band edge' or 2.4 GHz and 2.4835 GHz.

The method is given in Section 11 of FCC KDB 558074 and ANSI C63.10.

Results

The EUT passed. Low, middle and high channels were measured against the -20 dBc requirement, with the band edge results shown at 2.4 GHz and 2.4835 GHz.

Client	Interaxon Inc.

Power Spectral Density

Purpose

The purpose of this test is to ensure that the maximum power spectral density to the radiating element does not exceed the limits specified. This ensures that the modulation is significantly wide enough, or low enough in power that it will allow for co-operation of other wireless devices operating within this frequency allocation.

Limits and Method

The limits are defined in 15.247(e) and RSS-247 5.2(b).

For digitally modulated systems, the Power Spectral Density (PSD) conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

The method is given in Section 10.2 of FCC KDB 558074.

Results

The EUT passed. Low, medium, and high channels were tested. The worst case value is -15.7 dBm as measured with a 3 kHz resolution bandwidth (peak power).

Test Frequency (MHz)	Channel	Measured Reading (dBm)	External Attenuator + Cable loss (dB)	Output Power (dBm)	Output Limit (dBm)	Margin (dB)	Result
2402	Low	-25.82	10	-15.82	8	23.82	Pass
2440	Mid	-25.94	10	-15.94	8	23.94	Pass
2480	High	-25.67	10	-15.67	8	23.67	Pass

Graphs

The graphs shown below show the power spectral density conducted measurement of the device during transmit operation of the EUT with continuous modulated data. Low, middle, and high channels were investigated. An external attenuation and cable loss of 10dB are used. In the subsequent plots, line D2 is used to show the limit with this taken into account. Line D1 references the 8 dBm limit.

Transmitter Spurious Radiated Emissions

Purpose

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT does not exceed the limits listed below as defined in the applicable test standard, as measured from a receiving antenna. This helps protect broadcast radio services such as television, FM radio, pagers, cellular telephones, emergency services, and so on, from unwanted interference.

Limits and Method

The method is defined in Section 12 of FCC KDB 558074 and ANSI C63.10.

The requirement is stated in FCC 15.247(d), and RSS-247 5.5.

The restricted bands are defined in 47 CFR FCC Part 15.205(a) and RSS-Gen (Table 7).

The limits are as defined in 47 CFR FCC Part 15.209 and RSS- Gen (Table 5 and Table 6).

The limits apply for emissions that fall within the restricted bands.

The limits for unintentional radiated emissions apply for those emissions that fall in the restricted bands. These limits are as follows:

Frequency	Limit
0.009 MHz – 0.490 MHz	2400/F(kHz) uV/m at 300m ¹
0.490 MHz – 1.705 MHz	24000/F(kHz) uV/m at 30m ¹
1.705 MHz – 30 MHz	30 uV/m at 30m ¹
30 MHz – 88 MHz	100 uV/m (40.0 dBuV/m ¹) at 3m
88 MHz – 216 MHz	150 uV/m (43.5 dBuV/m ¹) at 3m
216 MHz – 960 MHz	200 uV/m (46.0 dBuV/m ¹) at 3m
Above 960 MHz	500 uV/m (54.0 dBuV/m ¹) at 3m
Above 1000 MHz	500 uV/m (54 dBuV/m ²) at 3m
Above 1000 MHz	500 uV/m (74 dBuV/m ³) at 3m

¹Limit is with Quasi Peak detector with bandwidths as defined in CISPR-16-1-1

²Limit is with 1 MHz measurement bandwidth and using an Average detector

³Limit is with 1 MHz measurement bandwidth and using a Peak detector

Additionally, all unintentional emissions must also meet the ‘Spurious Conducted Emissions’ requirements of -20 dBc or greater. See “Antenna Spurious Conducted Emissions (-20dBc Requirement)” section for further details.

Client	Interaxon Inc.	 Canada
Product	Muse MU-03	
Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Based on ANSI C63.4 Section 4.2, if the Peak detector measurements do not exceed the Quasi-Peak limits, where defined, then the EUT is deemed to have passed the requirements.

Typical Radiated Emissions Setup

Measurement Uncertainty

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is $\pm 4.25\text{dB}$ for 30MHz – 1GHz and $\pm 4.93\text{dB}$ for 1GHz – 18GHz with a 'k=2' coverage factor and a 95% confidence level.

Client	Interaxon Inc.	
Product	Muse MU-03	
Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Preliminary Graphs

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector over a full 0-360°. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

In accordance with FCC Part 15, Subpart A, Section 15.33, the device was scanned to the 10th harmonic.

Devices scanned may be scanned at alternate test distances and in accordance with FCC Part 15, Subpart A, Section 15.31, an extrapolation factor of 20 dB/decade was used above 30 MHz and 40 dB/decade below 30 MHz. For example for 1 meter measurements, an extrapolation factor 9.5 dB from 20 Log (1m / 3m) is applied. Except where stated, measurements are performed at a 3m measurement distance.

Low, middle and high channels, in the three orthogonal axis were investigated. Worst case graphs are presented.

All transmitters in the EUT are on and transmitting continuous modulated data at the maximum power setting used by the manufacturer.

Band-edge measurement graphs are also shown for illustration purposes. See final measurement section for all measurements.

Final Measurements and Results

The EUT passed. Low, middle, and high bands were measured.

In accordance with 15.247(d), only frequencies exceeding the 15.209 limit that occur within the bands listed in 15.205 need to be verified with a final detector. Emissions outside the restricted bands were measured for informational purposes.

The measurements were maximized by rotating the turn table over a full 0-360 rotation and the antenna height was varied from 1 m to 4 m.

Spurious Radiated Emissions Table

Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Power Line Conducted Emissions

Purpose

The purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT's power line does not exceed the limits listed below as defined in the applicable test standard, as measured from a LISN. This helps protect lower frequency radio services such as AM radio, shortwave radio, amateur radio operators, maritime radio, CB radio, and so on, from unwanted interference.

Limits and Method

The limits are as defined in FCC 15.207 and RSS-Gen Table 4.

Method is as defined in ANSI C63.4

Average Limits		Quasi-Peak Limits	
150 kHz – 500 kHz	56 to 46* dB μ V	150 kHz – 500 kHz	66 to 56* dB μ V
500 kHz – 5 MHz	46 dB μ V	500 kHz – 5 MHz	56 dB μ V
5 MHz – 30 MHz	50 dB μ V	5 MHz – 30 MHz	60 dB μ V

* Decreases linearly with the logarithm of the frequency

Both Quasi-Peak and Average limits are applicable and each is specified as being measured with a resolution bandwidth of 9 kHz. For Quasi-Peak, a video bandwidth at least three times greater than the resolution bandwidth is used.

Based on ANSI C63.4 Section 4.2, if the Peak or Quasi-Peak detector measurements do not exceed the Average limits, then the EUT is deemed to have passed the requirements.

Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Typical Setup Diagram

Measurement Uncertainty

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2 and is $\pm 2.73\text{dB}$ with a 'k=2' coverage factor and a 95% confidence level.

Preliminary Graphs

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector. This peaking process is done as a worst case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

The EUT is a battery operated device with a battery rechargeable via a USB port. Power line conducted emissions is performed while it is recharging using a representative support device (Lenovo ThinkPad 13 with Lenovo AC/DC Adapter model ADLX45NCC2A).

Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

Appendix A – EUT Summary

Client	Interaxon Inc.	
Product	Muse MU-03	
Standard(s)	RSS 247 Issue 2:2017 FCC Part 15 Subpart 15.247:2017	

For further details for filing purposes, refer to filing package.

General EUT Description

Client / Manufacturer Details	
Organization / Address	Interaxon Inc. Suite 900, 555 Richmond St. West Toronto, Ontario Canada, M5V 3B1
Contact	Sam MacKenzie
Phone	416-598-8989
Email	sam.mackenzie@interaxon.ca
EUT (Equipment Under Test) Details	
EUT Name	Muse
EUT Model / SN (if known)	MU-03
EUT is powered using	Battery
Input voltage range(s) (V)	4.5-6 VDC
Rated input current (A)	100 mA
Nominal power consumption (W)	0.5 W
Transmits RF energy? (describe)	BLE, 2.4 Ghz
Basic EUT functionality description	A device worn on the head which measures brain activity.
I/O cable description	Standard USB cable. USB-A to microUSB-B. 1m length
Available connectors on EUT	microUSB B
Peripherals required to exercise EUT	Lenovo ThinkPad 13 and Lenovo AC/DC Adapter model ADLX45NCC2A (removed for radio testing).
Dimensions of product (approx..)	L: 143mm, W: 123mm, H: 60mm

Note the EUT is considered to have been received the date of the commencement of the first test, unless otherwise stated.

For a close-up picture of the EUT, see 'Appendix B – EUT and Test Setup Photos'.
