5. Environmental evaluation and exposure limit according to FCC part 1, §1.1307, §1.1310

Limit for power density for general population/uncontrolled exposure is 0.6 mW/cm^2 .

The power density calculation is $S = [(Pt/0.6)/4\pi r^2]$.

Where:

Pt - The transmitted power (EIRP) (mW)

r - The distance from the unit. (cm)

The limit 0.6 mW/cm^2 can be calculated from the above based on the following data:

Pt- the transmitted power which is equal to the maximum peak output power 12.93 dBm plus internal antenna gain 5 dBi . The maximum peak EIRP = 17.93 dBm = 62.1 mW

Maximum allowed distance “r”, where RF exposure limits may not be exceeded,

$r = \text{SQRT}(103.5/4\pi)$ and is more than 3 cm from the antenna main lobe.

TEST DESCRIPTION:

The measurements were performed at the Anechoic chamber at a 3 m test distance. EUT was arranged on a polystyrene table 0.8 m height placed on the turn - table. The Active Loop antenna 1.0 - 30 MHz frequency range was used. The frequency range was investigated from 0.15 MHz to 30 MHz and the measurements were performed at each frequency at which the signal was 10 dB below the limit or less. The level was maximized by initially rotating turntable through 360°.

REQUIREMENTS:

EUT radiated emission shall not exceeds value required in section 15.209

TEST PROCEDURE

EUT was placed on a wooden table in a shielded chamber at a height of 80 cm from the floor and 40 cm from the vertical reference plane. The measurements were performed at mains terminals by means of LISN, connected to spectrum analyzer in the frequency range as referred to in the table above. The measurements were made with quasi-peak (CISPR) and average detectors. The position of the EUT cables was varied to determine maximum emission level.

TEST RESULT:

Test not applicable. EUT has battery power option only.
