NAp: Not Applicable

NAs: Not Asked

Note 1: Integral and dedicated antenna. Professionally installed equipment.

Note 2: See FCC part 15.247 (d).

Note 3: See FCC part 15.209. Unwanted emissions levels are all below the fundamental emission field strength level.

Note 4: The system hops to channel frequencies from a pseudo randomly ordered list of hopping frequencies. Each frequency is used equally on the average by the transmitter, and separated by a minimum of 25 kHz or 2/3 of 20 dB bandwidth of the hopping channel (see appendix 7).

The frequency hopping system uses 76 channels (see appendix 9).

The timing by channel is 1830 μ s (see appendix 8).

During 76 channels $\times$ 0.4 s = 30.4 s, any channel is used 34 times (see appendix 8), then $34 \times 1830 \mu$ s = 62.22 ms, thus the average time of occupancy on any channel is less than 400 ms within a period of 0.4 seconds multiplied by the number of hopping channels employed, in normal operating mode.

Note 5: Conducted measurement is not possible (integral antenna), so we used the radiated method in open field.

RF EXPOSURE:

Maximum measured power = 115.5 dB μ V/m = 60 mW

($P = (E \times d)^2 / (30 \times G_p)$ with $d = 3$ m and $G_p = 1.78$)

$PSD = EIRP / 4 \times \pi \times R^2 = 60 / 4 \times \pi \times (20 \text{ cm})^2 = 11.9 \times 10^{-3} \text{ mW/cm}^2$ (limit= 1 mW/cm²).

The equipment fulfils the requirements on power density for general population/uncontrolled exposure and therefore fulfils the requirements of 47 CFR §1.1310.

« To declare, or not, the compliance with the specifications, it was not explicitly taken into account of uncertainty associated with the result(s) »

**the peak level is lower than the average limit (54 dBμV/m).

Note: any spurious which has more than 20 dB of margin compared to the applicable limit is not necessarily reported.

Applicable limits: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The highest level recorded in a 100 kHz bandwidth is 115.5 dBμV/m on low channel .

So the applicable limit is 95.5 dBμV/m.

In addition, radiated emissions which fall in the restricted band, as defined in section 15.205 (a), must also comply with the radiated emission limits specified in section 15.209 (a) (see section 15.205 (c)).
