

RADIO TEST REPORT

No. 1405683STO-004 Ed. 2

RF performance

EQUIPMENT UNDER TEST

Equipment : Remote Terminal Unit with 3G connection
Type / model : R7-101
Additional model : R7-102
Manufacturer : Creowave Oy
Tested by request of : Creowave Oy

SUMMARY

Referring to the emission limits and the operating mode during the tests specified in this report the equipment complies with the requirements according to

47 CFR Part 2, Part 22 subpart H, Part 24 subpart E
RSS-Gen Issue 4 (2014) (not accredited),
RSS-132 Issue 3 (2013) (not accredited), RSS-133 Issue 6 (2013) (not accredited)

Date of issue: 2015-03-30

Tested by:  Matti Virkki

Approved by:  Stefan Andersson

Laboratories are accredited by the Swedish Board for Accreditation and Conformity Assessment (SWEDAC) under the terms of Swedish legislation. The accredited laboratory activities meet the requirements in SS-EN ISO/IEC 17025 (2005). This report may not be reproduced other than in full, except with the prior written approval by Intertek Semko.

This report is for the exclusive use of Intertek's Client and is provided pursuant to the agreement between Intertek and its Client. Intertek's responsibility and liability are limited to the terms and conditions of the agreement. Intertek assumes no liability to any party, other than to the Client in accordance with the agreement, for any loss, expense or damage occasioned by the use of this report. Only the Client is authorized to permit copying or distribution of this report and then only in its entirety. Any use of the Intertek name or one of its marks for the sale or advertisement of the tested material, product or service must first be approved in writing by Intertek. The observations and test results in this report are relevant only to the sample tested. This report by itself does not imply that the material, product, or service is or has ever been under an Intertek certification program.

1 CLIENT INFORMATION

The EUT has been tested by request of

Company: Creowave Oy
Yrtpellontie 10H
90230 Oulu
Finland

Name of contact: Taisto Soikkeli

2 EQUIPMENT UNDER TEST (EUT)

2.1 Identification of the EUT according to the manufacturer/client declaration

Equipment: Remote Terminal Unit
Tested Model: R7-101
Additional model: R7-102
Brand name: Creowave
Serial number: F9000170ABF0A
Manufacturer: Creowave Oy

Transmitter frequency range: 824.2 – 848.8 MHz, 826.4 – 846.6 MHz, 1850.2 – 1909.8 MHz,
1852.4 – 1907.6 MHz

Receiver frequency range: 869 – 894 MHz, 1930 – 1975 MHz

Frequency agile or hopping: ☐ Yes ☒ No

Antenna: ☐ Internal antenna ☒ External antenna

Antenna connector: ☐ None, internal antenna ☒ Yes, type N

Antenna gain:

Rating RF output power: 850 GSM 31.64 dBm, 1900 GSM 27.98 dBm,
850 EDGE 32 dBm, 1900 EDGE 27.98 dBm
850 WCDMA 26.18 dBm, 1900 WCDMA 24.37 dBm
(measured conducted)

Type of modulation: GMSK, QPSK

Temperature range: ☐ Category I (General): -20°C to +55°C
☐ Category II (Portable equipment): -10°C to +55°C
☐ Category III (Equipment for normal indoor use): +5°C to +35°C
☒ Other: -30°C to +55°C

Power rating: 12V

Transmitter standby mode supported: ☒ Yes ☐ No

2.2 Additional hardware information about the EUT

The EUT consists of the following units:

Unit	Part number	Serial number
Remote Terminal Unit	R7-101	F9000170ABF0A
3 x Antenna	Extronics iANT200-24-S-1	
Antenna	Aerial AV1950-1520FN1	
Antenna	Extronics iANT213-QB	

EUT has three identical Zigbee transceivers and a cellular radio module.

Models R-101 and R-102 are electrically identical.
R-102 model has connectors for armoured cables.

2.3 Additional information about the EUT

During the tests the EUT supported the following software:

Version / Release
1.0

2.4 Peripheral equipment

Peripheral equipment is defined as equipment needed for correct operation of the EUT during the tests, but not included as a part of the testing and evaluation of the EUT.

Equipment	Manufacturer / Type	Inventory number
PC	HP / Compaq NC6320	12913
Communication tester	Rohde & Schwarz CMW500	32597

2.5 Test signals

Continuous transmission on full power
GSM and EDGE modes GMSK modulation
WCDMA mode QPSK modulation

2.6 Modification during the tests

Band pass filters were added to 2,4 GHz rf outputs to prevent unwanted emissions.
Filter type ACFF-1024 (Avago, FBAR-filter).

3 TEST SPECIFICATIONS

3.1 Standards

47 CFR Part 2, Part 22 subpart H, Part 24 subpart E
RSS-Gen Issue 4 (2014), RSS-132 Issue 3 (2013), RSS-133 Issue 6 (2013)

Test methods in:

ANSI TIA 603-C (2004),
KDB 971168 D01

3.2 Additions, deviations and exclusions from standards and accreditation

RSS-GEN issue 4 RSS-132 Issue 3 (2013), RSS-133 Issue 6 (2013) are not within accreditation scope

No other additions, deviations or exclusions have been made from standards and accreditation.

3.3 Test site

Measurements were performed at:

Intertek Semko AB.
Torshamnsgatan 43,
P.O. Box 1103
SE-164 22 Kista

Intertek Semko AB is a FCC listed test site with site registration number 90913
Intertek Semko AB is a Industry Canada listed test facility with IC assigned code 2042G

Measurement chambers

Measurement Chamber	Type of chamber	IC Site filing #
Björk hallen	Semi-anechoic 3m	2042G-1
RADIOHALLEN	Fully-anechoic 3m	--

3.4 Test set-up

EUT antenna port was connected to spectrum analyser and communication tester via power divider rf-cables and 10 and 20 dB attenuators.

Analyser's Reference level offset was used to compensate cable and attenuator losses.

3.5 Test conditions

If not additionally specified, the tests were performed under the following environmental conditions:

Parameter	Normal	Extreme
Supplying voltage, V	12	-
Air temperature, °C	22	-

4 TEST SUMMARY

The results in this report apply only to the tested sample:

Test	Result	Section in report	Note
Standard test methods			
RF output power	Pass	5	
Modulation characteristics	Pass	12	
Occupied bandwidth	Pass	6	
Spurious emission at antenna terminals	Pass	7, 8	
Field strength of spurious radiation	Pass	10, 11	
Frequency stability	Pass	9	
	Pass		

NT = Not Tested, by request of the Client

NA = Not Applicable

5 RF OUTPUT POWER

Date of test:	2015-02-03 / 2015-02-17	Test location:	EMC Center
EUT Serial:	F9000170ABF0A	Ambient temp. °C	22 / 21
Tested by:	Matti Virkki	Relative humidity %	27 / 28
Test result:	Pass	Margin:	5.79 dB (conducted) 0.79 dB with iANT 213-QB

5.1 Requirement

Reference: FCC §2.1049, §22.913 (a)(2), RSS-132 section 5.4

The average power of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts ERP or 11.5 W EIRP.

Reference: FCC §24.232(c), RSS-133 6.4, SRSP-510 section 5.1.2

Mobile and portable stations are limited to 2 watts EIRP and the equipment must employ a means for limiting power to the minimum necessary for successful communications.

In addition, the transmitter's peak-to-average power ratio (PAPR) shall not exceed 13 dB for more than 0.1% of the time using a signal corresponding to the highest PAPR during periods of continuous transmission.

5.2 Test set-up

EUT antenna port was connected to spectrum analyser and communication tester via power divider rf-cables and 10 and 20 dB attenuators.

Analyser's Reference level offset was used to compensate cable and attenuator losses.

Date of test:	2014-07-02	Test location:	EMC Center
EUT Serial:	F9000170ABF0A	Ambient temp.	22°C
Tested by:	Matti Virkki	Relative humidity	39%
Test result:	Pass	Margin:	5.07 dB (conducted) 1.07 with iANT 213-QB

7.1 Requirement

§2.1051, RSS-GEN section 6.13

§22.917 (a) *Out of band emissions.*

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) *Measurement procedure.*

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (*i.e.* 100 kHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

RSS-132 section 5.5

Mobile and base station equipment shall comply with the limits in (i) and (ii) below.

In the first 1.0 MHz band immediately outside and adjacent to each of the sub-bands specified in [Section 5.1](#), the power of emissions per any 1% of the occupied bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p$ (watts).

After the first 1.0 MHz immediately outside and adjacent to each of the sub-bands, the power of emissions in any 100 kHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p$ (watts). If the measurement is performed using 1% of the occupied bandwidth, power integration over 100 kHz is required.

§24.238 (a) *Out of band emissions.*

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) *Measurement procedure.*

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (*i.e.* 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

RSS-133 section.6.51

Equipment shall comply with the limits in (i) and (ii) below.

In the 1.0 MHz bands immediately outside and adjacent to the equipment's operating frequency block, the emission power per any 1% of the emission bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} P(\text{watts})$.

After the first 1.0 MHz, the emission power in any 1 MHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} P(\text{watts})$. If the measurement is performed using 1% of the emission bandwidth, power integration over 1.0 MHz is required.

7.2 Test set-up

EUT antenna port was connected to spectrum analyser and communication tester via power divider rf-cables and 10 and 20 dB attenuators.

Analyser's Reference level offset was used to compensate cable and attenuator losses.

8 CONDUCTED SPURIOUS EMISSION

Date of test:	2015-02-04	Test location:	EMC Center
EUT Serial:	1234567893	Ambient temp.	22°C
Tested by:	Matti Virkki	Relative humidity	39%
Test result:	Pass	Margin:	>20 dB

8.1 Requirement

§2.1051, RSS-GEN section 6.13

§22.917 (a) *Out of band emissions.*

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) *Measurement procedure.*

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (*i.e.* 100 kHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

RSS-132 section 5.5

Mobile and base station equipment shall comply with the limits in (i) and (ii) below.

In the first 1.0 MHz band immediately outside and adjacent to each of the sub-bands specified in [Section 5.1](#), the power of emissions per any 1% of the occupied bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p$ (watts).

After the first 1.0 MHz immediately outside and adjacent to each of the sub-bands, the power of emissions in any 100 kHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p$ (watts). If the measurement is performed using 1% of the occupied bandwidth, power integration over 100 kHz is required.

§24.238 (a) *Out of band emissions.*

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) *Measurement procedure.*

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (*i.e.* 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

RSS-133 section.6.51

Equipment shall comply with the limits in (i) and (ii) below.

In the 1.0 MHz bands immediately outside and adjacent to the equipment's operating frequency block, the emission power per any 1% of the emission bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10}P(\text{watts})$.

After the first 1.0 MHz, the emission power in any 1 MHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10}P(\text{watts})$. If the measurement is performed using 1% of the emission bandwidth, power integration over 1.0 MHz is required

8.2 Test set-up

EUT antenna port was connected to spectrum analyser and communication tester via power divider rf-cables and 10 and 20 dB attenuators.

Analyser's Reference level offset was used to compensate cable and attenuator losses.

9 FREQUENCY STABILITY

Date of test:	2015-02-02	Test location:	EMC Center
EUT Serial:	F9000170ABF0A	Ambient temp.	22°C
Tested by:	Matti Virkki	Relative humidity	39%
Test result:	Pass	Margin:	2073 Hz

9.1 Requirement

Reference:

§2.1055 Measurements required: Frequency stability.

(a) The frequency stability shall be measured with variation of ambient temperature as follows:

(1) From -30° to +50° centigrade for all equipment e

(b) Frequency measurements shall be made at the extremes of the specified temperature range and at intervals of not more than 10° centigrade through the range.

§22.355 Frequency stability limit for mobile devices in 821 to 896 MHz range 2.5 ppm

§24.235 The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

RSS-GEN 6.11

With the transmitter installed in an environmental test chamber, the un-modulated carrier frequency shall be measured under the conditions specified below. A sufficient stabilization period at each temperature shall be used prior to each frequency measurement. The following temperatures and supply voltage ranges apply, unless specified otherwise in the applicable RSS:

(a) at the temperatures of -30°C (-22°F), +20°C (+68°F) and +50°C (+122°F), and at the manufacturer's rated supply voltage; and

(b) at the temperature of +20°C (+68°F) and at ±15% of the manufacturer's rated supply voltage.

RSS-132 5.3

The carrier frequency shall not depart from the reference frequency in excess of ±2.5 ppm for mobile stations and ±1.5 ppm for base stations.

RSS-133 6.3

The carrier frequency shall not depart from the reference frequency, in excess of ±2.5 ppm for mobile stations and ±1.0 ppm for base stations.

9.2 Test set-up

EUT was placed into climate chamber and set to un-modulated carrier test mode EUT antenna port was connected to spectrum analyser rf-cable and 10 dB attenuator.

10 RADIATED EMISSIONS MEASUREMENTS FROM 30 MHZ TO 1000MHZ

Date of test:	2015-02-10	Test location:	Björkhallen
EUT Serial:	F9000170ABF0A	Ambient temp.	23 °C
Tested by:	Matti Virkki	Relative humidity	35 %
Test result:	Pass	Margin:	>20 dB

1.1 Requirement

§2.1053, RSS-GEN section 6.13

§22.917 (a) Out of band emissions.

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) Measurement procedure.

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (i.e. 100 kHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

RSS-132 section 5.5

Mobile and base station equipment shall comply with the limits in (i) and (ii) below.

In the first 1.0 MHz band immediately outside and adjacent to each of the sub-bands specified in Section 5.1, the power of emissions per any 1% of the occupied bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} P$ (watts).

After the first 1.0 MHz immediately outside and adjacent to each of the sub-bands, the power of emissions in any 100 kHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} P$ (watts). If the measurement is performed using 1% of the occupied bandwidth, power integration over 100 kHz is required.

§24.238 (a) Out of band emissions.

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) Measurement procedure.

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (i.e. 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

RSS-133 section.6.51

Equipment shall comply with the limits in (i) and (ii) below.

In the 1.0 MHz bands immediately outside and adjacent to the equipment's operating frequency block, the emission power per any 1% of the emission bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p(\text{watts})$.

After the first 1.0 MHz, the emission power in any 1 MHz bandwidth shall be attenuated (in dB) below the transmitter output power P (dBW) by at least $43 + 10 \log_{10} p(\text{watts})$. If the measurement is performed using 1% of the emission bandwidth, power integration over 1.0 MHz is required

13 UNCERTAINTIES SUMMARY

The measurement uncertainty describes the overall uncertainty of the given measured value during operation of the EUT.

Measurement uncertainty is calculated in accordance with EA-4/02-1997.

The measurement uncertainty is given with a confidence of 95% (k=2).
