4. Test Set-up and Operation Modes

4.1 Principle of Configuration Selection

The test modes were adapted accordingly in reference to the instructions for use.

During testing, Channel and Power Controlling Software provided by the customer was used to control the operating channel as well as the output power level. The RF output power selection is for the setting of RF output power expected by the customer and is going to be fixed on the firmware of the final end product.

Mode, Data Rate	Channel Frequency		
	2402 MHz	2440 MHz	2480 MHz
BLE 1M	4	4	4
BLE 2M	4	4	4

4.2 Test Operation and Test Software

Setup for testing: The test sample itself is equipped with a touch screen, It was used to enable the operation modes listed in section 3.3 as appropriate by the screen.

The samples were used as follows:

Conducted: A001062667-008

Radiation: A002803673-017

Full test was applied on all test modes, but only worst case was shown

MK71521 was tested as the primary.

MK71521A does not built-in a 32.768kHz crystal oscillator(Y2).

The clock (32.768kHz) is for the system sleep, during which time the module does not transmit anything. The clock is used when system is sleeping and with it (MK71521) the system wakes up faster than the system without the clock (MK71521A). Both models have same electrically identical.

4.3 Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

Kind of Equipment	Manufacturer	Model Name
Notebook (Setup)	HP	TPN-C139

4.4 Countermeasures to achieve EMC Compliance

The test sample which has been tested contained the noise suppression parts as described in the Constructional Data Form or the Technical Construction File. No additional measures were employed to achieve compliance.

6. Safety Human exposure

6.1 Radio Frequency Exposure Compliance

6.1.1 Electromagnetic Fields

RESULT:**Passed**

Test standard : FCC KDB Publication 447498 D01

FCC:

Since maximum peak output power of the transmitter is 2.64 mW < 10mW, hence the EUT is excluded from SAR evaluation according to FCC KDB publication 447498: Mobile Portable RF Exposure

Canada:

Maximum conducted peak power:	2.64 mW
Antenna Gain:	-1.3 dbi
Maximum EIRP available	2 mW

Since maximum output power of the transmitter is 2.64mW(maximum power)<4mW (distance ≤5mm), hence the EUT is excluded from SAR evaluation according to Table 1 in ISED RSS-102, For limb-worn devices where the 10 gram value applies, the exemption limits for routine evaluation in Table 1 of ISED RSS-102 are multiplied by a factor of 2.5.
