Description of Test Item

The ultraBeacon is a combined BLE and ultrasound beacon used as a part of Forkbeard platform for indoors positioning.

The Forkbeard platform delivers near 100 times better distance accuracy than Bluetooth signals alone, allowing you to get down to centimeter level location accuracy in indoor environments. Combining the strength of ultrasound and Bluetooth with the formidable array of sensor technologies found in modern device platforms, Forkbeard accurately positions mobile devices such as smartphones, tablets and laptops with a latency of only up to 1 – 2 seconds. Moreover, the ultrasound technology always ensures >99.9% room-level location accuracy, which makes Forkbeard the only indoor positioning technology needed for any workflow, and way-finding applications.

1.7 Worst-Case Configuration and Mode

Radiated Emissions were performed with the EUT set to transmit at the channel with the highest output power as worst-case scenario.

1.8 Comments

All measurements were done with the EUT powered by a fully charged battery.

All ports were populated during spurious emission measurements.

2 TEST REPORT SUMMARY

2.1 General

All measurements are traceable to national standards.

The tests were conducted for demonstrating compliance with FCC CFR 47 Part 15, paragraph 15.247 and ISED Canada RSS-247 Issue 2 and RSS-GEN Issue 5.

Tests were performed in accordance with ANSI C63.4-2014 and ANSI C63.10-2013.

Radiated tests were made in a semi-anechoic chamber at measuring distances of 1m, 3m and 10m.

A description of the test facility is on file with FCC and ISED.

6.1 Power Line Conducted Emission

6.2 Test Site Radiated Emission

This test setup is used for all radiated emissions tests. For frequencies below 30 MHz the measuring distance is 10m, for all other frequencies it is 3m or 1m. Emissions above 1 GHz are measured with a Spectrum Analyzer and Horn Antenna. For measurements above 18 GHz the test receiver is moved inside the anechoic chamber and located next to the antenna to minimize the cable loss. All measurements at 1GHz and above were performed with turntable height 1.5m and with the ground plane covered by absorbers. A pre-amplifier is used for all measurements above 30 MHz, and High-Pass or Band-Pass filter is used for all harmonics.
