Below: Prescan 18-26 GHz at 5-10 cm distance.

The Offset of the analyzer is set to -20 dB - corresponding to a measurement distance of 30 cm.

In order to see the spurious signals on the plots the actual measurement distance was decreased to 5-10 cms which corresponds to an additional offset of 9.5 dB.

Measurement procedure: ANSI C63.10-2013 Clause 11.10

Test Results: Complies

Measurement Data:

The measurement procedure PKPSD described in ANSI C63.10-2013 was used.

Modulation Type and Bitrate	Measured Power Spectral Density (dBm/3kHz)		
	Low	Mid	High
BLE 1Mb	-8.8	-8.9	-9.0
BLE 2Mb	-10.1	-10.1	-10.2
Snobee	-5.8	-5.6	-6.4

The measured values are with 3kHz RBW.

Requirement for systems using Digital Modulation
The power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.
No requirements for Frequency Hopping Systems.

6 BLOCK DIAGRAM

6.1 Power Line Conducted Emission

6.2 Conducted Tests

This test set-up is used for all Conducted tests.
For Frequency Stability test the EUT was placed in a climatic chamber.

6.3 Test Site Radiated Emission

This test setup is used for all radiated emissions tests. For frequencies below 30 MHz the measuring distance is 10m, for all other frequencies it is 3m or 1m. Emissions above 1 GHz are measured with a Spectrum Analyzer and Horn Antenna. For measurements above 18 GHz the test receiver is moved inside the anechoic chamber and located next to the antenna to minimize the cable loss. All measurements at 1GHz and above were performed with turntable height 1.5m and with the ground plane covered by absorbers. A pre-amplifier is used for all measurements above 30 MHz, and High-Pass or Band-Pass filter is used for all harmonics.
