ANNOUNCEMENT

- This test report shall not be reproduced in full or partial, without the written approval of UL Japan, Inc.
- The results in this report apply only to the sample tested. (Laboratory was not involved in sampling.)
- This sample tested is in compliance with the limits of the above regulation.
- The test results in this test report are traceable to the national or international standards.
- This test report must not be used by the customer to claim product certification, approval, or endorsement by the A2LA accreditation body.
- This test report covers Radio technical requirements.
It does not cover administrative issues such as Manual or non-Radio test related Requirements. (if applicable)
- The all test items in this test report are conducted by UL Japan, Inc. Ise EMC Lab.
- The opinions and the interpretations to the result of the description in this report are outside scopes where UL Japan, Inc. has been accredited.
- The information provided from the customer for this report is identified in Section 1.
- For test report(s) referred in this report, the latest version (including any revisions) is always referred.

REVISION HISTORY

Original Test Report No. 14752026H-A

This report is a revised version of 14752026H-A. 14752026H-A is replaced with this report.

* The laboratory is exempted from liability of any test results affected from the above information in SECTION 2 and 4.

SECTION 2: Equipment Under Test (EUT)

2.1 Identification of EUT

Description	24GHz Radar Sensor Unit
Model Number	L75N57010
Serial Number	Refer to SECTION 4.2
Condition	Production model
Modification	No Modification by the test lab
Receipt Date	June 1, 2023
Test Date	June 1 to 9, 2023

2.2 Product Description

General Specification

Rating	DC 12 V
Operating temperature	-10 deg. C to +65 deg. C

Radio Specification

Radio Type	Transceiver
Frequency of Operation	24.09 GHz to 24.16 GHz
Bandwidth	70 MHz
Modulation	FMCW
Antenna Gain	15.86 dBi
Steerable Antenna	None
Usage location	Fixed use with helicopter

2.3 Variant model(s)

Tested model: L75N57010 has a variant model: L75N57011.

The difference of these models is only the installation position on the helicopter.

SECTION 3: Test specification, procedures & results

3.1 Test Specification

Test Specification	FCC Part 15 Subpart C The latest version on the first day of the testing period
Title	CC 47CFR Part15 Radio Frequency Device Subpart C Intentional Radiators Section 15.245 Operation within the bands 902 - 928MHz, 2435 - 2465MHz, 5785 - 5815MHz, 10500 - 10550MHz, and 24075 - 24175MHz. Remarks: The full port test filled all available ports was performed at the FCC part 15B. (Verification)

*Also the EUT complies with FCC Part 15 Subpart B.

3.2 Procedures and results

No.	Item	Test Procedure	Specification	Worst margin	Results	Remarks
1	Conducted Emission	ANSI C63.10-2013 6. Standard test methods	Section 15.207(a)	-	N/A	*1)

3	Electric Field Strength of Spurious Emission	ANSI C63.10-2013 6. Standard test methods 9. Procedures for testing millimeter-wave systems	Section 15.205 Section 15.209 Section 15.245(b)	1.3 dB 86.9 MHz Vertical	Complied	Radiated
4	-20 dB Bandwidth	ANSI C63.4:2009 13. Measurement of intentional radiators	Section 15.215(c)	-	Complied	Radiated

*Note: UL Japan, Inc.'s EMI Work Procedures: Work Instructions-ULID-003591 and Work Instructions-ULID-003593.

*1) The test is not applicable since the EUT is not the device that is designed to be connected to the public utility (AC) power line.

FCC Part 15.31 (e)

This EUT provides the stable voltage constantly to RF part regardless of input voltage.
Therefore, this EUT complies with the requirement.

FCC Part 15.203 Antenna requirement

It is impossible for end users to replace the antenna, because the antenna is mounted inside of the EUT.
Therefore, the equipment complies with the antenna requirement of Section 15.203.

3.3 Addition to standard

Item	Test Procedure	Specification	Worst margin	Results	Remarks
99 % Occupied Band Width	RSS-Gen 4.6.1	RSS-Gen 4.6.1	N/A	-	Radiated

Other than above, no addition, exclusion nor deviation has been made from the standard.

3.4 Uncertainty

Measurement uncertainty is not taken into account when stating conformity with a specified requirement.
Note: When margins obtained from test results are less than the measurement uncertainty, the test results may exceed the limit.

The following uncertainties have been calculated to provide a confidence level of 95% using a coverage factor $k = 2$.

Radiated emission

Measurement distance	Frequency range		Uncertainty (+/-)

SECTION 4: Operation of EUT during testing

4.1 Operating Modes

Mode	Test Item
Transmitting mode - 24.09 GHz - 24.125 GHz - 24.16 GHz	Radiated Emission (Electric Field Strength of Fundamental and Spurious Emission)
Normal Operation mode	Radiated Emission (Electric Field Strength of Fundamental and Spurious Emission), -20 dB Bandwidth and 99 % Occupied Bandwidth, Duty Cycle
*Power of the EUT was set by the software as follows; Power Setting: 6 Software: S-Takaya,ST234-001,230531-01 (Date: 2023.05.31, Storage location: EUT memory) *This setting of software is the worst case. Any conditions under the normal use do not exceed the condition of setting. In addition, end users cannot change the settings of the output power of the product. Justification: The system was configured in typical fashion (as a user would normally use it) for testing.	

4.2 Configuration and peripherals

Radiated Emission (Below 1 GHz) test

* Test data was taken under worse case conditions.

SECTION 5: Radiated emission (Electric Field Strength of Fundamental and Spurious Emission)

Test Procedure and conditions

[For below 30 MHz]

EUT was placed on a carpet for insulation above a reference ground plane. EUT was set up typical spacing for the other equipment.

The EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for vertical polarization (antenna angle: 0 deg., 45 deg., 90 deg., 135 deg and 180 deg.) and horizontal polarization.

*Refer to Figure 1 about Direction of the Loop Antenna.

[For below 1 GHz]

EUT was placed on a carpet for insulation above a reference ground plane. EUT was set up typical spacing for the other equipment.

The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with a ground plane.

[For above 1 GHz, up to 40 GHz]

EUT was placed on a carpet for insulation above a reference ground plane. EUT was set up typical spacing for the other equipment.

For 1 GHz to 10 GHz

The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with absorbent materials lined on a ground plane.

For 10 GHz to 40 GHz

The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with a ground plane.

The height of the measuring antenna varied between 1 m and 4 m (frequency range 9 kHz to 30 MHz: loop antenna was fixed height at 1.0 m) and EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength.

Test antenna was aimed at the EUT for receiving the maximum signal and always kept within the illumination area of the 3 dB beamwidth of the antenna.

The measurements were performed for both vertical and horizontal antenna polarization with the Test Receiver, or the Spectrum Analyzer.

The measurements were made with the following detector function of the test receiver and the Spectrum analyzer (in linear voltage average mode).

The test was made with the detector (RBW/VBW) in the following table.

When using Spectrum analyzer, the test was made with adjusting span to zero by using peak hold.

Test Antennas are used as below;

Frequency	Below 30 MHz	30 MHz to 200 MHz	200 MHz to 1 GHz	Above 1 GHz
Antenna Type	Loop	Biconical	Logperiodic	Horn

Frequency	9 kHz to 150 kHz	150 kHz to 30 MHz	30 MHz to 1 GHz	1 GHz to 40 GHz	
Instrument used	Test Receiver	Test Receiver	Test Receiver	Spectrum Analyzer	
Detector	QP, Average *1)	QP, Average *1)	QP	Peak	Average
IF Bandwidth	BW 200 Hz	BW 9 kHz	BW 120 kHz	RBW: 1 MHz VBW: 3 MHz	RBW: 1 MHz VBW: 10 Hz Voltage avg.

*1) Although these tests were performed other than open field test site, adequate comparison measurements were confirmed against 30 m open field test site. Therefore sufficient tests were made to demonstrate that the alternative site produces results that correlate with the ones of tests made in an open field based on KDB 414788.

[About fundamental measurement]

The carrier levels were confirmed at maximum direction of transmission. The maximum direction was searched under carefully since beam-widths are narrow.

The carrier levels were measured in the far field. The distance of the far field was calculated from follow equation.

$$r = \frac{2D^2}{\lambda}$$

where

r is the distance from the radiating element of the EUT to the edge of the far field, in m

D is the largest dimension of both the radiating element and the test antenna (horn), in m

(The antenna aperture size of test antenna was used for this calculation.)

λ is the wavelength of the emission under investigation $[300 / f \text{ (MHz)} * 10^3]$, in millimeter

Frequency [GHz]	Wavelength λ [mm]	Maximum Aperture Dimension			Far Field Boundary r [m]
		EUT [m]	Test Antenna (MHA-16) [m]	Maximum D [m]	
24.160	12.4	0.041	0.058	0.058	0.542

[Above 40 GHz]

The test was performed based on “Procedures for testing millimeter-wave systems” of ANSI C63.10-2013.

EUT was placed on a carpet for insulation above a reference ground plane. EUT was set up typical spacing for the other equipment.

Set spectrum analyzer RBW, VBW, span, etc., to the proper values. Note these values. Enable two traces—one set to “clear write,” and the other set to “max hold.” Begin hand-held measurements with the test antenna (horn) at a distance of 1 m from the EUT in a horizontally polarized position. Slowly adjust its position, entirely covering the plane 1 m from the EUT. Observation of the two active traces on the spectrum analyzer will allow refined horn positioning at the point(s) of maximum field intensity. Repeat with the horn in a vertically polarized position. If the emission cannot be detected at 1 m, reduce the RBW to increase system sensitivity. Note the value. If the emission still cannot be detected, move the horn closer to the EUT, noting the distance at which a measurement is made.

Detector	Peak	Average
IF Bandwidth	RBW: 1 MHz VBW: 3 MHz	RBW: 1 MHz VBW: 10 Hz Voltage avg.

[Test setup]
40 GHz to 50 GHz

Distance Factor: $20 \times \log (1.00 \text{ m}^* / 3.0 \text{ m}) = -9.5 \text{ dB}$
*Test Distance: 1.00 m

50 GHz to 75 GHz

Distance Factor: $20 \times \log (0.75 \text{ m}^* / 3.0 \text{ m}) = -12.0 \text{ dB}$
*Test Distance: 0.75 m

75 GHz to 100 GHz

Distance Factor: $20 \times \log (0.50 \text{ m}^* / 3.0 \text{ m}) = -15.5 \text{ dB}$
*Test Distance: 0.50 m

The test was made on EUT at the normal use position.

*The result is rounded off to the second decimal place, so some differences might be observed.

*Hyphens for Last Calibration Date and Cal Int (month) are instruments that Calibration is not required (e.g. software), or instruments checked in advance before use.

The expiration date of the calibration is the end of the expired month.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.
