

CERTIFICATION TEST REPORT

CFR 47 Part 15 Subpart B

Test Report File No.	14-IST-0575	☒ Basic	☐ Alternate
Date of Receipt	Sep. 04, 2014	Begin of test date	Oct. 01, 2014
Date of Issue	Oct. 17, 2014	End of test date	Oct. 02, 2014

Kind of Product	Action Camera
FCC Model(s)	360FLYBLK
IC Model(s)	360FLYBLK
FCC ID	2ADDK-360FLYBLK
IC ID	12404A-360FLYBLK

Applicant	360fly, Inc.
Address	1000 Town Center Way, Suite 200 Canonsburg PA 15317, USA.
Manufacturer	WOOJEON&HANDAN CO., LTD.
Address	569-12 Kasan-dong, Kumchon-ku, Seoul, Korea, 153-803

Standard	Section 15.107, Section 15.109 [Class B Equipment] ICES-003, Section 3

Comment(s)

- Investigations requested : Measurement to the relevant clauses of FCC rules and regulations Part 15 Subpart B - Unintentional Radiators, Class B.
- The test report with appendix consists of 20 pages.
- The test result only responds to the tested sample.
- It is not allowed to copy this report even partly without the allowance of IST EMC Laboratory.
- This equipment as for has been shown to be capable of continued compliance with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in ANSI C63.4

Water-proof	5ATM (With Microphone Plug)
Water-resistant	IP6X (Without Microphone Plug)
Operating Temperature	-4° to 140°F / -20° to 60°C
Power	
Power Source	Built-In Li-Polymer battery (1600mA), DC 3.7 V
Charging Method	Through Power Cradle using bundled USB cable
Full Charging Time	Approx. 3hrs 30min @ 500mA, 2hr 10min @ 1A
Size & Weight	
Dimensions (Approx.)	Main Device (61mm (Diameter) x 59.5mm(H)) Power Cradle (45.6mm(Dia) x 12.3mm(H)) TiltMount (50mm(Dia) x 25.8mm(H))
Weight (Approx.)	Main Device (138g) Power Cradle – TBD TiltMount (30.6g)

- EMC suppression device is not used during the test.
- Please refer to user's manual.

DESCRIPTIONS OF TEST

Conducted Emissions:

The measurement were performed over the frequency range of 0.15 MHz to 30 MHz using a 50 Ω /50uH LISN as the input transducer to a Spectrum Analyzer or a Field Intensity Meter. The measurements were made with the detector set for "Peak" amplitude within a bandwidth of 10KHz or for "quasi-peak" & "Average" within a bandwidth of 9 KHz.

-Procedure of Test

The line-conducted facility is located inside a shielded room No.2. A 1 m X 1.5 m wooden table 80 cm height is placed 40 cm away from the vertical wall and 1.5 m away from the other wall of the shielded room. The R/S ESH3-Z5 and Hyup-Rip KMW-407 LISN are bonded to bottom of the shielded room. The EUT is located on the wooden table with distance more than 80 cm from the LISN and powered from the Hyup-Rip LISN. The peripheral equipment is powered from the other LISN. Power to the LISNs are filtered by a noise cut power line filters. All electrical cables are shielded by braided tinned steel tubing with inner ϕ 1.2 cm. If the EUT is a DC-powered device, power will be derived from the source power supply it normally will be powered from and this supply lines will be connected to the Hyup-Rip LISN. All interconnected cables more than 1 m were shortened by non-inductive bundling to a 1 m length. Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating conditions. The RF output of the LISN was connected to the R/S receiver to determine the frequency producing the maximum emission from the EUT. The frequency producing the maximum level was reexamined using Quasi-Peak mode by manual measurement, after scanned by automatic Peak mode for frequency range from 0.15 to 30 MHz. The bandwidth of the receiver was set to 10 kHz. The EUT, peripheral equipment, and interconnecting cables were arranged and manipulated to maximize each EME emission.

DESCRIPTION OF TEST

Radiated Emissions:

The measurement was performed over the frequency range of 30 MHz to 1 GHz using antenna as the input transducer to a Spectrum analyzer or a Field Intensity Meter. The measurement was made with the detector set for "quasi-peak" within a bandwidth of 120 KHz.

-Procedure of Test

Preliminary measurements were made at 3 meter using bi-log antennas, and spectrum analyzer to determine the frequency producing the max. emission in anechoic chamber. Appropriate precaution was taken to ensure that all emission from the EUT were maximized and investigated. The system configuration, mode of operation, turn-table azimuth and height with respect to the antenna were noted for each frequency found. The spectrum was scanned from 30 MHz to 1000 MHz using S/B bi-log antenna. Above 1 GHz, linearly polarized double ridge horn antennas were used. Final measurements were made at open site with 3-meters test distance using S/B bi-log antenna. The OATS have been verified in regular for its normalized site attenuation. The test equipment was placed on a wooden table. Sufficient time for the EUT, peripheral equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. Each frequency found during pre-scan measurements was re-examined by manual. The detector function was set to CISPR quasi-peak mode and the bandwidth of the receiver was set to 120 kHz or 1 MHz depending on the frequency of type of signal. The EUT, peripheral equipment and interconnecting cables were re-configured to the set-up producing the max. emission for the frequency and were placed on top of a 0.8-meter high nonmetallic 1 x 1.5 meter table. The EUT, peripheral equipment, and interconnecting cables were re-arranged and manipulated to maximize each emission. The turntable containing the system was rotated; the antenna height was varied 1 to 4 meters and stopped at the azimuth or height producing the maximum emission. Each emission was maximized by: varying the mode of operation to the EUT and/or peripheral equipment and changing the polarity of the antenna, whichever determined the worst-case emission.

Equipment Under Test

EUT Type :

- ☒ Table-Top. ☐ Floor-Standing.
☐ Table-Top and Floor-Standing(Combination).

Operation - mode of the E.U.T. :

The equipment under test was operated during the measurement under following conditions :

- ☐ Standby Mode
☒ Operational Condition : ☒ Charging + File Up&Down

Configuration of the equipment under test :

Following peripheral devices and interface cables were connected during the measurement :

Equipment	Type	Brand	Serial No.
Action Camera	360FLYBLK	360fly, Inc.	140900006520015980
Laptop	LG15N53	LG ELECTRONICS	404QCPY560240
Adapter(Laptop)	ADP-65JH BB	DELTA ELECTRONICS, INC.	69IW43403WP
I phone	A1387	Apple Inc.	DQGJX0TLDTDF

Connecting Interface Cables :

AC Power Cable : 1.2 m (Unshielded)

USB Cable(Micro 5pin to USB) : 0.5 m (Unshielded)

Note :

Test Set-Up

Conducted Emissions

Radiated Emissions

SUMMARY

Emissions

■ Conducted Emission

The requirements are	● MET	○ Not MET
Minimum limit margin	17.20 dB at 0.150 MHz	
Maximum limit exceeding		
Remarks : Limits are kept with more than 3 dB margin.		

■ Radiated Emission(Limits Below 1 GHz)

The requirements are	● MET	○ Not MET
Minimum limit margin	3.61 dB at 237.415 MHz	
Maximum limit exceeding		
Remarks : Limits are kept with more than 3 dB margin.		

■ Radiated Emission(Limits Above 1 GHz)

The requirements are	● MET	○ Not MET
Minimum limit margin	20.41 dB at 4.874 GHz	
Maximum limit exceeding		
Remarks : Limits are kept with more than 3 dB margin.		

Sample Calculation

Conducted Emission

Sample Signal Strength Calculation

$S(\text{Result}) = \text{Measurement} + \text{IL} + \text{CL}$

$\text{Margin} = \text{Limit} - S(\text{Result})$

$S(\text{Result}) = \text{Signal Strength}$

$\text{Measurement} = \text{Voltage at the Receiver}$

$\text{IL} = \text{LISN Insertion Loss}$

$\text{CL} = \text{Cable Loss}$

For example at 15.402 MHz if the measured voltage is 45.35 dBuV, the Cable loss is 0.15 dB, the insertion loss is 0.74 dB, the signal strength would be calculated:

$S(\text{Result}) = 45.35 + 0.15 + 0.74 = 46.24 \text{ dBuV}$

$\text{Margin} = 60 \text{ dBuV} - 46.24 \text{ dBuV} = 13.76 \text{ dB}$

Radiated Emission

Sample Field Strength Calculation

$\text{FS}(\text{Result}) = \text{Reading} + \text{AF} + \text{CL}$

$\text{Margin} = \text{Limit} - \text{FS}(\text{Result})$

$\text{FS}(\text{Result}) = \text{Field Strength}$

$\text{Reading} = \text{Measured Voltage at the Receiver}$

$\text{AF} = \text{Antenna Factor}$

$\text{CL} = \text{Cable Loss}$

For example at 240.000 MHz if the measured voltage is 21.70 dBuV with an antenna Distance of 3 meters, the field intensity would be calculated:

$\text{Limit}[\text{dBuV/m}] = 200[\text{uV/m}] = 20\log(200) = 46.00 \text{ dBuV/m}$

$\text{FS}(\text{Result}) = 21.70 + 10.71 + 2.28 = 34.69 \text{ dBuV/m}$

$\text{Margin} = 46.00 \text{ dBuV/m} - 34.69 \text{ dBuV/m} = 11.31 \text{ dB}$
