EUT receive date: March 21, 2017

EUT receive condition: The pre-production version of the EUT was received in good condition with no apparent damage. As declared by the Applicant, it is identical to the production units.

Test start date: March 21, 2017

Test completion date: June 27, 2017

The test results in this report pertain only to the item tested.

2.0 General Information

2.1 Product Description

Levven Automation Inc. supplied the following description of the EUT:

The product covered by this report is a permanently connected wireless controller for lighting system. It is intended for household / commercial, indoor dry locations; and installed inside a junction box that supports light fixtures. All products covered in this report must be installed in accordance with local electrical codes.

This test report covers only the 903-927MHz radio.

Applicant	Levven Automation Inc.
Model Number	GC10, GPC10, GDT15, GPDT15 & GPC20
FCC Identifier	2ADH9-G2CF
IC Identifier	12453A-G2CF
Modulation Technique	Digital Transmission System (DTS)
Rated RF Output	13.97 dBm
Frequency Range	903 – 927 MHz
Type of modulation	2GFSK
Number of Channel(s)	33
Antenna(s) & Gain	•Antenna is single wire quarter wave monopole •Antenna gain theoretical maximum will have a gain of 5.19 dBi (3db higher than a theoretical dipole 2.19 dBi).
Applicant Name & Address	Levven Automation Inc. 9741 54 Avenue Edmonton, AB T6E 5J4 Canada

2.2 Related Submittal(s) Grants

None.

2.3 Test Methodology

Antenna conducted measurements were performed according to the FCC documents “Guidance for Performing Compliance Measurement on Digital Transmission Systems (DTS) Operating under §15.247” (KDB 558074 D01 DTS MEAS GUIDANCE V04), and RSS-247, RSS-GEN, and

Radiated emissions and AC mains conducted emissions measurements were performed according to the procedures in ANSI C63.10: 2013. Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the "Data Sheet" of this report.

2.4 Test Facility

The test site used to collect the radiated data is site 1 (10-m semi-anechoic chamber). This test facility and site measurement data have been fully placed on file with the FCC, IC and A2LA accredited.

2.5 Measurement Uncertainty

Compliance with the limits was based on the results of the measurements and doesn't take into account the measurement uncertainty.

Estimated Measurement Uncertainty

Measurement	Expanded Uncertainty (k=2)		
	0.15 MHz – 1 GHz	1 GHz – 2.5 GHz	> 2.5 GHz
RF Power and Power Density – antenna conducted	-	0.7 dB	-
Unwanted emissions - antenna conducted	1.1 dB	1.3 dB	1.9 dB
Bandwidth – antenna conducted	-	30 Hz	-

Measurement	Expanded Uncertainty (k=2)			
	0.15 MHz – 30MHz	30 – 200 MHz	200 MHz – 1 GHz	1 GHz – 18 GHz
Radiated emissions	-	4.7	4.6	5.1 dB
AC mains conducted emissions	2.1 dB	-	-	-

3.0 System Test Configuration

3.1 Support Equipment and description

None

3.2 Block Diagram of Test Setup

Equipment Under Test		
Product Name	Product Model #	Serial Number
Genius Control 10	GC10	MPK1703211148-003 (Conducted)
Genius Pro Control 10	GPC10	MPK1703211148-004 (Radiated)

		MPK1703211148-002 (Radiated)

Antenna was removed and co-axial connector with a cable was installed for Conducted Measurements.

S = Shielded
U = Unshielded

F = With Ferrite
M = Meter

3.3 Justification

Testing was performed for all modulation/data rate modes.

Unless otherwise stated in this report, measurements made for Power Density, Bandwidth, Conducted Spurious, Radiated Spurious were made with the worst case power setting

Genius Control 10 and Genius Pro Control 10 are same design and components, the differences are Genius Control 10 is single voltage and Genius Pro Control 10 is dual voltage.

Genius Dimmer 15 and Genius Pro Dimmer 15 are same design and components, the differences are Genius Dimmer 15 is single voltage and Genius Pro Dimmer 15 is dual voltage.

Genius Control 10, Genius Pro Control 10, Genius Dimmer 15, Genius Pro Dimmer 15 & Genius Pro Control 20 use the same 903-927MHz Radio. Transmitter Output power, Radiated Spurious and AC Line Emissions were conducted on each model.

3.4 Mode of Operation During Test

During transmitter testing, the transmitter was setup to transmit at maximum RF power on low, middle and high frequencies/channels.

During transmitter testing, the transmitter was setup to transmit using the maximum RF power setting provided by the manufacturer. Their corresponding output power in dBm can be found in section 4.2 of this report.

3.5 Modifications Required for Compliance

No modifications were made by the manufacturer or Intertek to the EUT in order to bring the EUT into compliance.

3.6 Additions, Deviations and Exclusions from Standards

No additions, deviations or exclusions from the standard were made.

4.0 Measurement Results

4.1 6-dB Bandwidth and 99% Occupied Bandwidth FCC Rule: 15.247(a)(2); RSS-247 A8.2 and RSS-GEN;

4.1.1 Requirement

The minimum 6-dB bandwidth shall be at least 500 kHz

4.1.2 Procedure

A spectrum analyzer was connected to the antenna port of the transmitter.

For FCC 6dB Channel Bandwidth the Procedure described in the FCC Publication 558074 D01 DTS Meas Guidance v04 was used to determine the DTS occupied bandwidth. Section 8.1 Option 1 was used.

1. Set RBW = 100 kHz.
2. Set the video bandwidth (VBW) $\geq 3 \times$ RBW.
3. Detector = Peak.
4. Trace mode = max hold.
5. Sweep = auto couple.
6. Allow the trace to stabilize.
7. Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

For 99% power bandwidth measurement, the bandwidth was determined by using the built-in 99% occupied bandwidth function of the spectrum analyzer. The resolution bandwidth is set to 1% of the selected span as is without being below 1%. The video bandwidth shall be set to 3 times the resolution bandwidth.

Test Date:	March 27, 2017

4.2 Maximum Conducted Output Power at Antenna Terminals FCC Rule 15.247(b)(3)

4.2.1 Requirement

For antennas with gains of 6 dBi or less, maximum allowed transmitter output is 1 watt (+30 dBm).
For antennas with gains greater than 6 dBi, transmitter output level must be decreased appropriately, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

4.2.2 Procedure

The antenna port of the EUT was connected to the input of a spectrum analyzer to measure the Maximum Conducted Transmitter Output Power. The offset programmed on the analyzer is corrected to include cable loss & attenuator.

The procedure described in FCC Publication 558074 D01 DTS Meas Guidance v04 was used. Specifically, section 9.1.1 RBW $\geq$ DTS Bandwidth was utilized as the spectrum analyzer's resolution bandwidth was greater than the DTS bandwidth.

1. Set the RBW $\geq$ DTS Bandwidth
2. Set the VBW $\geq 3 \times$ RBW
3. Set the span $\geq 3 \times$ RBW
4. Sweep time = Auto couple
5. Detector = Peak
6. Trace mode = Max Hold
7. Allow trace to fully stabilize
8. Use peak marker function to determine the peak amplitude level.

A spectrum analyzer was connected to the antenna port of the transmitter.

4.3 Power Spectral Density FCC 15.247 (e)

4.3.1 Requirement

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna should not be greater than 8dBm in any 3 kHz band during any time interval of continuous transmission.

4.3.2 Procedure

The antenna port of the EUT was connected to the input of a spectrum analyzer to measure the Transmitter Power Density (PSD). The offset programmed on the analyzer is corrected to include cable loss, attenuator.

The procedure described in FCC Publication 558074 D01 DTS Meas Guidance, specifically section 10.2 Method PKPSD (peak PSD).

1. Set analyzer center frequency to DTS channel center frequency.
2. Set the span to 1.5 times the *DTS bandwidth*.
3. Set the RBW to: $3 \text{ kHz} \leq \text{RBW} \leq 100 \text{ kHz}$.
4. Set the VBW $\geq 3 \times \text{RBW}$.
5. Detector = peak.
6. Sweep time = auto couple.
7. Trace mode = max hold.
8. Allow trace to fully stabilize.
9. Use the peak marker function to determine the maximum amplitude level within the RBW.
10. If measured value exceeds limit, reduce RBW (no less than 3 kHz) and repeat.

4.4 Out-of-Band Conducted Emissions FCC 15.247(d)

4.4.1 Requirement

In any 100 kHz bandwidths outside the EUT pass-band, the RF power shall be at least 20dB (peak) or 30 dB (average) below that of the maximum in-band 100 kHz emissions.

4.4.2 Procedure

A spectrum analyzer was connected to the antenna port of the transmitter. Analyzer Resolution Bandwidth was set to 100 kHz. For each channel investigated, the in-band and out-of-band emission measurements were performed. The out-of-band emissions were measured from 30 MHz to 10 GHz.

4.4.3 Test Result

Refer to the following plots 4.1 – 4.5 for unwanted conducted emissions. The plot shows -20dB attenuation limit line.

4.5 Transmitter Radiated Emissions FCC Rule 15.247(d), 15.209, 15.205; RSS-247

4.5.1 Requirement

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

For out of band radiated emissions (except for frequencies in restricted bands), in any 100 kHz bandwidths outside the EUT pass-band, the RF power shall be at least 20dB (peak) or 30 dB (average) below that of the maximum in-band 100 kHz emissions.

4.5.2 Procedure – Radiated Emissions

Radiated emission measurements were performed from 30 MHz to 10 GHz according to the procedure described in ANSI C64.10. Spectrum Analyzer Resolution Bandwidth is 100 kHz or greater for frequencies 30 MHz to 1000 MHz, 1 MHz for frequencies above 1000 MHz. Above 1000 MHz Peak and Average measurements were performed.

The EUT is placed on a plastic turntable that is 80 cm in height for below 1000MHz and 1.5m in height for above 1GHz. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). During testing, all cables were manipulated to produce worst-case emissions. The signal is maximized through rotation. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters.

Radiated emissions are taken at 3 meters for frequencies above 1 GHz and at 10 meters for frequencies below 1 GHz.

Measurements made from 30MHz to 1GHz had a notch filter in place. Measurements made from 1 GHz to 10GHz had a high pass filter in place. A preamp was used from 30MHz to 10GHz.

All measurements were made with a Peak Detector and compared to QP limits for 30MHz – 1GHz and Average limits for 1GHz – 10GHz.

Data is included of the worst-case configuration (the configuration which resulted in the highest emission levels).

4.5.3 Field Strength Calculation

Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$FS = RA + AF + CF - AG - \delta$ (**for average measurement only**); if measurement is performed at a distance other than specified in the rule, a Distance Correction Factor (DCF) shall be added.

Where FS = Field Strength in dB(μ V/m)

RA = Receiver Amplitude (including preamplifier) in dB(μ V)

AF = Antenna Factor in dB(1/m)

CF = Cable Attenuation Factor in dB

AG = Amplifier Gain in dB

δ = **Duty cycle correction factor, see Annex A**

Assume a receiver reading of 52.0 dB(μ V) is obtained. The antennas factor of 7.4 dB(1/m) and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving field strength of 32 dB(μ V/m). This value in dB(μ V/m) was converted to its corresponding level in μ V/m.

RA = 52.0 dB(μ V)

AF = 7.4 dB(1/m)

CF = 1.6 dB

AG = 29.0 dB

δ = **20.0 dB**

$FS = 52.0 + 7.4 + 1.6 - 29.0 = 32$ dB(μ V/m) Peak.

$FS = 52.0 + 7.4 + 1.6 - 29.0 - 20.0 = 12$ dB(μ V/m) Average.

Test Date:	March 24 – June 14, 2017
------------	--------------------------

Result:	Complies by 0.31dB
----------------	---------------------------

4.5.4 Test Results

GC10 & GPC10

Test Results: 15.209 Radiated Spurious Emissions Low Channel, Tx at 903MHz

Out-of-Band Radiated Spurious Emissions - 30 MHz to 1000 MHz

Radiated Spurious Emissions 1000 - 18000 MHz, Peak Scan vs Peak Limit

4.5.5 Test Setup Photographs

4.5.8 Test Setup Photographs (Continued)

4.5.8 Test Setup Photographs (Continued)

4.5.8 Test Setup Photographs (Continued)

4.6 AC Line Conducted Emission FCC: 15.207

4.6.1 Requirement

Frequency Band MHz	FCC 15.207 Limit dB(μV)	
	Quasi-Peak	Average
0.15-0.50	66 to 56 *	56 to 46 *
0.50-5.00	56	46
5.00-30.00	60	50

*Note: *Decreases linearly with the logarithm of the frequency at the transition frequency the lower limit applies.*

4.6.2 Procedure

Measurements are carried out using quasi-peak and average detector receivers in accordance with CISPR 16. An AMN is required to provide a defined impedance at high frequencies across the power feed at the point of measurement of terminal voltage and also to provide isolation of the circuit under test from the ambient noise on the power lines. An AMN as defined in CISPR 16 shall be used.

The EUT is located so that the distance between the boundary of the EUT and the closest surface of the AMN is 0.8m.

Where a flexible mains cord is provided by the manufacturer, this shall be 1m long or if in excess of 1m, the excess cable is folded back and forth as far as possible so as to form a bundle not exceeding 0.4m in length.

The EUT is arranged and connected with cables terminated in accordance with the product specification.

Conducted disturbance is measured between the phase lead and the reference ground, and between the neutral lead and the reference ground. Both measured values are reported.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. A vertical, metal reference plane is placed 0.4m from the EUT. The vertical metal reference-plane is at least 2m by 2m. The EUT shall be kept at least 0.8m from any other metal surface or other ground plane not being part of the EUT. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for larger EUT.

Floor standing EUT are placed on a horizontal metal ground plane and isolated from the ground plane by resting on an insulating material. The metal ground plane extends at least 0.5m beyond the boundaries of the EUT and has minimum dimensions of 2m by 2m.

Equipment setup for conducted disturbance tests followed the guidelines of ANSI C63.4:2014.

Tested By:	Anderson Soungpanya
Test Date:	March 30, 2017

4.6.3 Test Results

The EUT met the conducted disturbance requirement of FCC 15.207 with the transmitter on.

5.0 List of Test Equipment

Measurement equipment used for emission compliance testing utilized the equipment on the following list:

Equipment	Manufacturer	Model/Type	Asset #	Cal Int	Cal Due
Spectrum Analyzer	Rohde and Schwarz	FSU	ITS 00913	12	01/12/18
Pre-Amplifier (1-18GHz)	Miteq	AMF-4D-001180-24-10P	ITS 00526	12	09/29/17
Horn Antenna	ETS-Lindgren	3117	ITS 01325	12	09/07/17
High Pass Filter	Reactel	7HS-1.5G/15G-S11	ITS 001416	12	05/03/18
Notch Filter	Micro-Tronics	BRM50722	ITS 01170	12	01/19/18
EMI Receiver	Rohde and Schwarz	ESU	ITS 00961	12	07/07/17
BI-Log Antenna	Antenna Research	LPB-2513	ITS 00355	12	09/09/17
Pre-Amplifier	Sonoma Instrument	310	ITS 01493	12	09/28/17
LISN	FCC	FCC-LISN-50-50-M-H	ITS 00551	12	09/14/17
RE Cable	TRU Corporation	TRU CORE 300	ITS 1462	12	08/24/17
RE Cable	TRU Corporation	TRU CORE 300	ITS 1465	12	08/24/17
RE Cable	TRU Corporation	TRU CORE 300	ITS 1470	12	08/24/17
Attenuator	Mini Circuits	BW-N3W5+	ITS 1315	12	10/19/17
Notch Filter	MICRO-TRONICS	BRM50702	ITS 1166	12	12/08/18
Attenuator	Weinschel	50-10	ITS 1224	12	11/08/17
RE Cable	Megaphase	EMC1-K1K1-236	IT 1538	12	06/13/18
RE Cable	Megaphase	EMC1-K1K1-19	ITS 1482	12	08/25/17
RE Cable	Megaphase	TM40-K1K1-19	ITS 1154	12	01/26/18
Transient Limiter	COM-POWER	LIT-153A	ITS 1452	12	06/19/18
RE Cable	TRU Corporation	TRU CORE 300	ITS 1462	12	08/24/17

Software used for emission compliance testing utilized the following:

Name	Manufacturer	Version	Template/Profile
Tile	Quantum Change	3.4.K.22	Conducted Spurious_30M-26GHz
BAT-EMC	Nexio	3.16.0.64	102960041_Levven.bpp
RS Commander	Rohde Schwarz	1.6.4	Not Applicable (Screen grabber)

Annex A - Duty Cycle Measurement

A.1 Procedure

ANSI C63.10:2013; Section 7.5

Unless otherwise specified, when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 s (100 ms). In cases where the pulse train exceeds 0.1 s, the measured field strength shall be determined during a 0.1 s interval. The following procedure is an example of how the average value may be determined. The average field strength may be found by measuring the peak pulse amplitude (in log equivalent units) and determining the duty cycle correction factor (in dB) associated with the pulse modulation as shown in Equation:

$$\delta \text{ (dB)} = 20 \log (\Delta)$$

where

δ is the duty cycle correction factor (dB)

Δ is the duty cycle (dimensionless)

This correction factor may then be subtracted from the peak pulse amplitude (in dB) to find the average emission. This correction may be applied to all emissions that demonstrate the same pulse timing characteristics as the fundamental emission (e.g., the fundamental and harmonic emissions). In cases where the pulse train is truly random or pseudo random, some regulatory agencies may accept a declaration by the manufacturer of the worst-case value of t_{ON} .

When the duty cycle correction factor is calculated to be less than -20.0 dB, -20.0 dB is used to find the average emission.

A.2 Test Results

GC10 & GPC10

Date: 27.JUN.2017 09:42:37

Duty Cycle: $DC = 9.86 / 100 = 0.0986$ or 9.86%

Duty Cycle Correction Factor δ (dB) = $20 \log(0.0986) = -20.1$ dB

GDT15 & GPDT15

Date: 27.JUN.2017 10:32:33

Duty Cycle: $DC = 9.86 / 100 = 0.0986$ or 9.86%

Duty Cycle Correction Factor δ (dB) = $20 \log (0.0986) = -20.1$ dB

GPC20

Date: 27.JUN.2017 10:30:10

Duty Cycle: $DC = 9.62/100 = 0.0962$ or 9.62%

Duty Cycle Correction Factor δ (dB) = $20 \log (0.0962) = -20.3$ dB
