2. HSDPA modulation mode has not been tested to prove USA FCC Part 27 and Canada IC RSS-139 compliance because it is an improved mode of operation only for Downlink (UE reception), but using the normal WCDMA mode for UL (Up Link, UE transmission). Therefore HSDPA has no associated a Power class or modulation scheme different than WCDMA mode for the UL transmission.

Taking into account the above comments, testing in HSDPA modulation mode is redundant for FCC Parts 27 and IC RSS-139 as it is the same as WCDMA mode as long as UE transmission is concerned. WCDMA modulation mode has been tested as indicated on the present test report.

RF Output Power (conducted and E.I.R.P.)

SPECIFICATION

FCC §2.1046 and §27.50. RSS-139 Clause 6.4.

Fixed, mobile and portable (hand-held) stations operating in the 1710–1755 MHz band are limited to a peak Equivalent Isotropically Radiated Power (E.I.R.P.) of 1 Watt (30 dBm).

The peak-to-average ratio (PAR) of the transmission shall not exceed 13 dB.

RSS-130 Clause 4.4.

The e.i.r.p. shall not exceed 50 watts (46.99 dBm) for mobile equipment or for outdoor fixed subscriber equipment nor shall it exceed 5 watts (36.99 dBm) for portable equipment or for indoor fixed subscriber equipment.

The peak-to-average ratio (PAR) of the transmission shall not exceed 13 dB.

RSS-199 Clause 4.4.

For mobile subscriber equipment, the e.i.r.p. shall not exceed 2 watts (33 dBm).

METHOD

The conducted RF output power measurements were made at the RF output terminals of the EUT using the power meter of the Universal Radio Communication tester R&S CMU200 and CMW500, selecting maximum transmission power of the EUT and different modes of modulation.

The maximum effective radiated power e.i.r.p. is calculated by adding the declared maximum antenna gain (dBi).

Modulation Characteristics

SPECIFICATION

FCC §2.1047.

RSS-139. Clause 6.2. RSS-130. Clause 4.1. RSS-199. Clause 4.1.: The devices shall employ digital modulation techniques.

METHOD

For 3G, the EUT operates with WCDMA (QPSK) and HSUPA (QPSK) modes, in which the information is digitised and coded into a bit stream.

For LTE the EUT operates with QPSK and 16QAM modulation modes in which the information is digitised and coded into a bit stream. The RF transmission is multiplexed using *Orthogonal Frequency Division Multiplexing (OFDM)* using different possible arrangement of subcarriers (Resource Blocks RB).

RESULTS

The following plots show the modulation schemes in the EUT.

Frequency Stability

SPECIFICATION

FCC §2.1055 and §27.54. RSS-139 Clause 6.3. RSS-130. Clause 4.3. RSS-199. Clause 4.3.

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

METHOD

The frequency tolerance measurements over temperature variations were made over the temperature range of -30°C to $+50^{\circ}\text{C}$. The EUT was placed inside a climatic chamber and the temperature was raised hourly in 10°C steps from -30°C up to $+50^{\circ}\text{C}$.

For hand carried, battery powered equipment, reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.

The EUT was set in “call mode” in the middle channel using the Universal Radio Communication tester R&S CMU200 or CMW500 and the maximum frequency error was measured using the built-in calibrated frequency meter.

For LTE mode the QPSK modulation was used for the test as it is the worst case for conducted power.

RESULTS

All measured frequency errors are less than ± 35 Hz which is sufficient to ensure that the fundamental emissions at Band Edges stays within the authorized blocks (see test results for “Spurious emissions at antenna terminals at Block Edges” in the next pages).

Verdict: PASS

Spurious emissions at antenna terminals

SPECIFICATION

FCC §2.1051 and §27.53 (g) (h) (m). RSS-139 Clause 6.5. RSS-130 Clause 4.6.

According to specification. the power of emissions shall be attenuated below the transmitter power (P) by a factor of at least $43 + 10 \log (P)$ dB. P in watts.

RSS-199 Clause 4.6.

For mobile subscriber equipment, the power of any unwanted emissions measured as above shall be attenuated (in dB) below the transmitter power, P (dBW), by at least:

- i) $40 + 10 \log p$ from the channel edges to 5 MHz away,
- ii) $43 + 10 \log p$ between 5 MHz and X MHz from the channel edges, and
- iii) $55 + 10 \log p$ at X MHz and beyond from the channel edges.
- iv) in addition, the attenuation shall be not be less than $43 + 10 \log p$ on all frequencies between 2490.5 MHz and 2496 MHz and $55 + 10 \log p$ at or below 2490.5 MHz.

At P_o transmitting power. the specified minimum attenuation becomes $40+10\log (P_o)$. and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [40 + 10 \log (P_o \text{ in mwatts}) - 30] = -10 \text{ dBm}$$

At P_o transmitting power. the specified minimum attenuation becomes $43+10\log (P_o)$. and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [43 + 10 \log (P_o \text{ in mwatts}) - 30] = -13 \text{ dBm}$$

At P_o transmitting power. the specified minimum attenuation becomes $55+10\log (P_o)$. and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [55 + 10 \log (P_o \text{ in mwatts}) - 30] = -25 \text{ dBm}$$

METHOD

The EUT RF output connector was connected to a spectrum analyser and to the Universal Radio Communication tester R&S CMU200 and CMW500 (selecting maximum transmission power of the EUT and different modes of modulation) using a 50 ohm attenuator and a power splitter.

The spectrum was investigated from 9 kHz to 18 GHz for 3G Band IV and LTE Band IV.

The spectrum was investigated from 9 kHz to 26 GHz for LTE Band VII.

The spectrum was investigated from 9 kHz to 8 GHz for LTE Band XII.

The reading of the spectrum analyser is corrected with the attenuation loss of connection between output terminal of EUT and input of the spectrum analyser.

For LTE mode the configuration of Resource Blocks and modulation which is the worst case for conducted power was used.

Radiated emissions

SPECIFICATION

FCC §2.1051 and §27.53(g) (h) (m). RSS-139 Clause 6.5. RSS-130 Clause 4.6.

According to specification. the power of emissions shall be attenuated below the transmitter power (P) by a factor of at least $43 + 10 \log (P)$ dB. P in watts.

RSS-199 Clause 4.6.

For mobile subscriber equipment, the power of any unwanted emissions measured as above shall be attenuated (in dB) below the transmitter power, P (dBW), by at least:

- i) $40 + 10 \log p$ from the channel edges to 5 MHz away,
- ii) $43 + 10 \log p$ between 5 MHz and X MHz from the channel edges, and
- iii) $55 + 10 \log p$ at X MHz and beyond from the channel edges.
- iv) in addition, the attenuation shall be not be less than $43 + 10 \log p$ on all frequencies between 2490.5 MHz and 2496 MHz and $55 + 10 \log p$ at or below 2490.5 MHz.

At P_o transmitting power. the specified minimum attenuation becomes $40+10\log (P_o)$. and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [40 + 10 \log (P_o \text{ in mwatts}) - 30] = -10 \text{ dBm}$$

At P_o transmitting power. the specified minimum attenuation becomes $43+10\log (P_o)$. and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [43 + 10 \log (P_o \text{ in mwatts}) - 30] = -13 \text{ dBm}$$

At P_o transmitting power. the specified minimum attenuation becomes $55+10\log (P_o)$. and the level in dBm relative P_o becomes:

$$P_o \text{ (dBm)} - [55 + 10 \log (P_o \text{ in mwatts}) - 30] = -25 \text{ dBm}$$

METHOD

The measurement was performed with the EUT inside an anechoic chamber. The spectrum was scanned from 30 MHz to at least the 10th harmonic of the highest frequency generated within the equipment.

The EUT was placed on a 1 meter high non-conductive stand at a 3 meter distance from the measuring antenna for measurements below 1 GHz and at 1 m distance for measurements above 1 GHz.

Detected emissions were maximized at each frequency by rotating the EUT and adjusting the measuring antenna height and polarization. The maximum meter reading was recorded. The radiated emissions were measured with peak detector and 1 MHz bandwidth.

Each detected emission is substituted by the Substitution method, in accordance with the ANSI/TIA/EIA-603-C: 2004.
