ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC CFR 47 Part 15E. The sample tested was found to comply with the requirements defined in the applied rules.

1.4 PRODUCT INFORMATION

1.4.1 Technical Description

The Equipment Under Test (EUT) was a Yota Devices Ltd YotaPhone2/ YD201. A full technical description can be found in the manufacturer's documentation.

1.5 TEST CONDITIONS

For all tests the EUT was set up in accordance with the relevant test standard and to represent typical operating conditions. Tests were applied with the EUT situated in a shielded enclosure.

The EUT was powered from a 3.8 V DC supply.

FCC Measurement Facility Registration Number
90987 Octagon House, Fareham Test Laboratory

1.6 DEVIATIONS FROM THE STANDARD

No other deviations from the applicable test standard were made during testing.

Power Limits - The plots show results using a 100 kHz resolution bandwidth, this is a deviation to the measurement method in the KDB. There would be no effect on the result.

2.1.5 Test Procedure

A test environment and testing arrangement meeting the specification of ANSI C63.4 was used during all testing. The Equipment Under Test (EUT) was set upon a non-conducting platform at an elevation of 80 cm above a horizontal reference ground plane. A vertical reference ground plane was situated 40 cm from the EUT and bonded to the horizontal reference ground plane.

The EUT was powered by a Line Impedance Stabilization Network (LISN), whereby emissions measurements of the current-carrying conductors were made through this LISN. The LISN was bonded to the horizontal reference ground plane with a separation distance greater than 80 cm from the EUT. A mains supply cable of 1 m length was used to supply mains power to the EUT from the LISN.

A preliminary emissions scan was conducted for each current-carrying conductor of the EUT, using a peak detector over a frequency range of 150 kHz to 30 MHz. At least six of the greatest peak emissions, frequency positions were selected from each preliminary emissions scan for further evaluation as final measuring points.

Final measurement points were measured using quasi-peak and average detectors. All final measurements were assessed against the emission limits in Clause 15.207 of FCC CFR 47 FCC Part 15.

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 15.407 (a) and KDB 789033 D01 General UNII Test Procedures 1 Old Rules v01r04.

The EUT was transmitting at maximum power, for bottom, middle and top channels with a data rate that was determined to produce the greatest average RF output power. The EUT was connected to a spectrum analyser via a cable and attenuator. The Analyser settings were adjusted to an RBW of at least 1% of the emission bandwidth with a video bandwidth of 3 x RBW. The analyser was configured with peak detector and trace set to max hold. The peak point of the trace was measured and the markers positioned to give the -26 dBc points of the displayed spectrum.

The plots on the following pages show the resultant display from the Spectrum Analyser.

The test was performed on the worst case data rate for 802.11(n) - 40 MHz BW modulation. The worst case was deemed as the data rate which produced the highest level of conducted average power. This data rate was MCS0.

2.3.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.3.5 Test Procedure

For Conducted Power, the path loss between the EUT and Power Sensor was measured using a Network Analyser. The path loss at the measurement frequency was entered as an offset. The EUT was set to transmit at maximum power at 100% duty cycle on the worst case data rate. All measurements were performed FCC 789033 D01 General UNII Test Procedures 1 Old Rules v01r04. Conducted measurements were performed according to, clause E.3.a whereas radiated measurements were additionally performed using the methods described in ANSI C63.10.

For radiated power, the EUT was transmitted at maximum power. The signal was observed on the Spectrum Analyser with a 1 MHz RBW using a Double Ridge Guide antenna at 3 metres from the EUT. The signal was maximised by rotating the EUT 360° and a height search of the measuring antenna. A substitution was then performed using a substitution antenna and signal generator.

This level was maximised by adjusting the height of the measuring antenna once more. The level from the signal generator was then adjusted to achieve the same raw result as with the EUT. This level was then corrected to account for cable loss and antenna factor. A calculation was then performed to obtain the final figure.

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 15.407 (a) and KDB 789033 D01 General UNII Test Procedures 1 Old Rules v01r04.

The EUT was transmitted at maximum power for bottom, middle and top channels with a data rate that was determined to produce the greatest average RF output power. In addition, all modulation types were tested for Peak Excursion on each test in each applicable frequency band. The EUT was connected to the Spectrum Analyser via attenuators and cables. For Trace 1, the analyser settings were configured with an RBW of 1 MHz and video bandwidth of 3MHz. The trace was set to a 10 second sweep time using an RMS detector. The maximum value was recorded for Power Spectral Density. For Trace 2, the RBW was set to 1MHz and the VBW to 3MHz. A Peak detector and Max Hold were used with a 10 second sweep time. The peak value was found and referenced to the Peak in Trace 1 to give the Peak Excursion.
