1. General Information

1.1. EUT Description

Product Name	garment steamer
Brand Name	Miraguar
Model No.	MRG-1008R
Working Voltage	DC 3V
Frequency Range	315MHz
Channel Number	1
Type of Modulation	ASK
Data Rate	<1kbps
Antenna Type	PCB Antenna
Peak Antenna Gain	0dBi

Working Frequency of Each Channel:							
Channel	Frequency						
00	315MHz						

1.2. Mode of Operation

QuieTek has verified the construction and function in typical operation. All the test modes were carried out with the EUT in normal operation, which was shown in this test report and defined as:

Test Mode
Mode 1: Transmit

Note:

1. Regards to the frequency band operation: the lowest, middle and highest frequency of channel were selected to perform the test, then shown on this report.
2. For portable device, radiated spurious emission was verified over X, Y, Z Axis, and shown the worst case on this report.

1.3. Tested System Details

The types for all equipments, plus descriptions of all cables used in the tested system (including inserted cards) are:

3.2. Test Setup

3.3. Limit

FCC Part 15 Subpart C Paragraph 15.207 Limits		
Frequency (MHz)	QP (dBuV)	AV (dBuV)
0.15 - 0.50	66 - 56	56 – 46
0.50 - 5.0	56	46
5.0 - 30	60	50

Note 1: The lower limit shall apply at the transition frequencies.

Note 2: The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.5 MHz.

3.4. Test Procedure

The EUT was setup according to ANSI C63.4, 2009 and tested according to KDB 558074 for compliance to FCC 47CFR 15.247 requirements. The EUT was placed on a platform of nominal size, 1 m by 1.5 m, raised 80 cm above the conducting ground plane. The vertical conducting plane was located 40 cm to the rear of the EUT. All other surfaces of EUT were at least 80 cm from any other grounded conducting surface. The EUT and simulators are connected to the main power through a line impedance stabilization network (LISN). The LISN provides a 50 ohm /50uH coupling impedance for the measuring equipment. The peripheral devices are also connected to the main power through a LISN. (Please refer to the block diagram of the test setup and photographs) Each current-carrying conductor of the EUT power cord, except the ground (safety) conductor, was individually connected through a LISN to the input power source.

The excess length of the power cord between the EUT and the LISN receptacle were folded back and forth at the center of the lead to form a bundle not exceeding 40 cm in length. Conducted emissions were investigated over the frequency range from 0.15MHz to 30MHz using a receiver bandwidth of 9 kHz.

3.5. Uncertainty

The measurement uncertainty is defined as ± 2.02 dB

3.6. Test Result

The EUT has no AC input port, test is not applicable.

4.2. Test Setup

Below 1GHz Test Setup:

Above 1GHz Test Setup:

4.3. Limit

FCC Part 15 Subpart C Paragraph 15.209		
Frequency (MHz)	Distance (m)	Level (dB μ V/m)
30 - 88	3	40
88 - 216	3	43.5
216 - 960	3	46
Above 960	3	54

Note 1: The lower limit shall apply at the transition frequency.

Note 2: Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the device or system.

Note 3: E field strength (dB μ V/m) = 20 log E field strength (μ V/m)

Field strength of emissions from intentional radiators operated under 15.231(b) shall not exceed the following:

Fundamental frequency (MHz)	Field strength of fundamental (μ V/m)	Field strength of spurious emissions (μ V/m)
40.66-40.70	2250	225
70-130	1250	125
130-174	11250 to 3750	1125 to 375
174-260	3750	375
260-470	13750 to 12500	1375 to 1250
Above 470	12500	1250

(1) The above field strength limits are specified at a distance of 3 meters. The tighter limits apply at the band edges.

(2) Intentional radiators operating under the provisions of this section shall demonstrate compliance with the limits on the field strength of emissions, as shown in the above table, based on the average value of the measured emissions. As an alternative, compliance with the limits in the above table may be based on the use of measurement instrumentation with a CISPR quasi-peak detector. The specific method of measurement employed shall be specified in the application for equipment authorization. If average emission measurements are employed, the provisions in §15.35 for averaging pulsed emissions and for limiting peak emissions apply. Further, compliance with the provisions of §15.205 shall be demonstrated using the measurement instrumentation specified in that section.

(3) Where F is the frequency in MHz, the formulas for calculating the maximum permitted fundamental field strengths are as follow: for the band 130-174MHz, μ V/m at 3 meters= $56.81818(F)-6136.3636$; for the band 260-470MHz, μ V/m at 3 meters= $41.6667(F)-7083.3333$.

4.4. Test Procedure

The EUT was setup according to ANSI C63.4 and tested according to ANSI C63.10 for compliance to FCC 47CFR 15.231 requirements.

The EUT is placed on a turn table which is 0.8 meter above ground. The turn table is rotated 360 degrees to determine the position of the maximum emission level. The EUT was positioned such that the distance from antenna to the EUT was 3 meters.

The antenna is scanned from 1 meter to 4 meters to find out the maximum emission level. This is repeated for both horizontal and vertical polarization of the antenna. In order to find the maximum emission, all of the interface cables were manipulated according to ANSI C63.4 on radiated measurement.

The resolution bandwidth below 1GHz setting on the field strength meter is 120 kHz and above 1GHz is 1MHz.

The frequency range from 30MHz to 10th harmonic is checked.

Note: When doing emission measurement above 1GHz, the horn antenna will be bended down a little (as horn antenna has the narrow beamwidth) in order to keeping the antenna in the "cone of radiation" of EUT. The 3dB beamwidth is 10~60 degrees for H-plane and 10~90 degrees for E-plane.

4.5. Uncertainty

The measurement uncertainty above 1G is defined as ± 3.9 dB
below 1G is defined as ± 3.8 dB

4.6. Test Result

All of the test result shown indicates the worst case, and spectrum analyzer parameters setting as shown below:

Peak detector: RBW = 1MHz, VBW = 3MHz, sweep time = 200ms;

Average detector: Peak Level – DCCF

For the operating frequency 315MHz, the fundamental emission limit level shall be $41.6667 \times (315) - 7083.3333 \mu\text{V/m} = 75.63 \text{ dB } \mu\text{V/m}$, the harmonics emission limit level shall be $55.63 \text{ dB } \mu\text{V/m}$, based on average detector.

For the DCCF (Duty cycle factor)

$$\text{DCCF} = -20 \log[(1.2 \text{ ms} \times 12 + 0.4 \text{ ms} \times 13)] / 38.93 \text{ ms} = -20 \log(19.6 / 38.93) = 5.96 \text{ dB}$$

Note 2: The radiated emission was verified over X, Y, Z Axis, and found the worst case is Y Axis.

Only record the test data of this direction.

Note 3: For below 1GHz, Measure Level = Reading Level + Cable Loss + Antenna Factor;
For above 1GHz, Measure Level = Reading Level + Cable Loss + Antenna Factor - Preamplifier Gain.

Note 4: For frequency higher than 1890MHz and other frequency, no significant emission detected.

Note: All equipments are calibrated with traceable calibrations. Each calibration is traceable to the national or international standards.

5.2. Test Setup

5.3. Limit

The 20 dB bandwidth of the emission shall be no wider than 0.25% of the center frequency. Therefore, the 20dB bandwidth of the emission limit shall be $315\text{MHz} \times 0.25\% = 0.7875\text{MHz}$.

5.4. Test Procedure

The EUT was tested according to ANSI C63.10 for compliance to FCC 47CFR 15.231(c) requirements.

Set RBW = 10 kHz, VBW = 30kHz, Span=1MHz, use 20dB bandwidth function to test the result.

5.5. Uncertainty

The measurement uncertainty is defined as $\pm 1 \text{ kHz}$

5.6. Test Result

Note: All equipments are calibrated with traceable calibrations. Each calibration is traceable to the national or international standards.

6.2. Test Setup

6.3. Limit

A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

6.4. Test Procedure

The EUT was tested under radiated method. Set the center frequency at the operating frequency and set the span to zero. Set suitable sweep time and capture the transmission after make the switch on. After release the switch record the time plots to check the release time.

6.5. Uncertainty

The measurement uncertainty is defined as $\pm 0.00005\text{ms}$

6.6. Test Result

Press on the EUT and then release, and it will be shut down within 5 seconds, so the test result for this item is pass.

7. Antenna Requirement

7.1. Requirement

According to FCC 15.203, an intentional radiator shall be designed to ensure that no antenna other than furnished by the responsible party shall be used with the device.

7.2. Result

The EUT is equipped with integrate antenna, which can't be replaced by other antenna. So the EUT complied with the antenna requirement of section 15.203.

The End
