

HITEM

ADDENDUM TO TEST REPORT 95696-19

2.4 GHz Transmitter Module Model: Skybell

Tested To The Following Standards:

FCC Part 15 Subpart C Section(s)
15.247

Report No.: 95696-19A

Date of issue: February 9, 2015

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

ADMINISTRATIVE INFORMATION

Test Report Information

REPORT PREPARED FOR:

HITEM
7420 Carroll Rd
San Diego, CA 92121

REPRESENTATIVE: Seton Kasmir
Customer Reference Number: 85

DATE OF EQUIPMENT RECEIPT:**DATE(S) OF TESTING:****REPORT PREPARED BY:**

Terri Rayle
CKC Laboratories, Inc.
5046 Sierra Pines Drive
Mariposa, CA 95338

Project Number: 95696

August 29, 2014

August 29 – November 13, 2014

Revision History

Original: Testing of 2.4 GHz Transmitter Module, Model: Skybell to FCC Part 15 Subpart C Section(s), 15.247.

Addendum A: To replace the blank data plots in conducted spurious and radiated spurious emission sections (page 29 and 33) and added equipment to the table/list to cover the frequency range tested for radiated spurious emissions (page 31).

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S):
CKC Laboratories, Inc.
110 Olinda Place
Brea, CA 92823

SUMMARY OF RESULTS

Standard / Specification: FCC Part 15 Subpart C

Test Procedure	Description	Modifications*	Results
15.31(e)	Voltage Variation	NA	Pass
15.247(a)(2)	-6dB Occupied Bandwidth	NA	Pass
15.247(b)(3)	RF Power Output	NA	Pass
15.247(d)	Conducted Spurious Emissions	NA	Pass
15.247(d) / 15.209	Radiated Spurious Emissions and Band Edge	NA	Pass
15.247(e)	Power Spectral Density	NA	Pass

NA=Not Applicable

Modifications*/Conditions During Testing

This list is a summary of the conditions noted for or modifications made to the equipment during testing.

Summary of Conditions
No modifications were made during testing.

***Modifications listed above must be incorporated into all production units.**

EQUIPMENT UNDER TEST (EUT)

EQUIPMENT UNDER TEST

2.4 GHz Transmitter Module

Manuf: HITEM

Model: Skybell

Serial: NA

PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

Laptop

Manuf: Dell

Model: Averatec

Serial: 00045-436-018

Power Supply

Manuf: Topward

Model: 6306D

Serial: 988614

FCC PART 15 SUBPART C

This report contains EMC emissions test results under United States Federal Communications Commission (FCC) CFR 47 Section 15 Subpart C requirements for Intentional Radiators.

15.31(e) Voltage Variations

Test Conditions / Setup

Test Location: CKC Laboratories, Inc. • 110 N. Olinda Place • Brea, CA 92823 • 714 993-6112

Customer: **HITEM**

Specification: **15.31(e) Voltage Variation on Power**

Work Order #: **95696**

Date: 9/10/2014

Test Type: **Maximized Emissions**

Equipment: 2.4 GHz transmitter module

Manufacturer: HITEM

Tested By: E. Wong

Model: Skybell

S/N: (none)

Test Equipment:

Asset #	Description	Model	Calibration Date	Cal Due Date
00787	Preamp	83017A	5/31/2013	5/31/2015
01646	Horn Antenna	3115	3/18/2014	3/18/2016
02869	Spectrum Analyzer	E4440A	7/10/2014	7/10/2015
P04382	Cable	LDF-50	7/30/2014	7/30/2016
P06360	Cable	L1-PNMNM-48	7/29/2014	7/29/2016

Wireless Test Fixture	HITEM	Generic	Generic
Power Supply	LITEON	PA-1600-05	3600324901

Test Conditions / Notes:

The equipment under test (EUT) is a wireless module which is installed in the test fixture. The external antenna is connected to an antenna port. The EUT is connected to a remotely located laptop computer via USB cable. The computer is running software Production Test GUI to setup EUT transmitting protocol.

The test frequencies are 2412MHz, 2442MHz, and 2472MHz.

An external DC power adapter is also connected to the wireless test fixture.

Frequency range of measurement, 2400MHz to 2483.5MHz.

Temperature: 21°C

Relative Humidity: 45%

Pressure: 100kPa

Site D

15.31(e) compliance: the supply voltage was varied between 85% and 115% of the nominal rated supply voltage of the developer board where the device was installed in. The installation does not provide provision of varying DC voltage to the module. No change in the fundamental signal level was observed.

Equipment Under Test (* = EUT):

Function	Manufacturer	Model #	S/N
2.4 GHz transmitter module*	HITEM	Skybell	NA

Support Devices:

Function	Manufacturer	Model #	S/N
Laptop	Dell	Averatec	00045-436-018
Power Supply	Topward	6306D	988614

Test Conditions / Notes:

The EUT seeking Limited Module Approval is installed on a development board and place on the Styrofoam surface of 10 cm thickness. The development board is connected to a support laptop. The laptop is running test routine to exercise the intended functionalities of the EUT.

Frequency range of EUT: 2400- 2483.5MHz

Frequencies of EUT during testing: 2412, 2442, 2472MHz

Protocol : 802.11b, 802.11g, 802.11n-mcs3, 802.11n-mcs7

Test environment conditions:

Temperature: 29°C

Relative Humidity: 40%

Pressure: 100kPa

Frequency range of measurement for this data sheet= 9kHz- 25GHz.

9kHz -150kHz;RBW=200Hz,VBW=200Hz;150kHz-30MHz;RBW=9kHz,VBW=9 kHz;30 MHz-1000 MHz;RBW=120kHz,VBW=120kHz,1000 MHz-25000MHz;RBW=1MHz,VBW=1MHz.

Emission profile of the EUT rotated along three orthogonal axes was investigated. Besides the contained band edge emissions, there were no emissions found within 20dB of the limit line in the range of 9kHz to 25GHz.

Ext Attn: 0 dB

Measurement Data:

Reading listed by margin.

Test Distance: 3 Meters

Band Edge

Test Conditions / Setup

Test Location: CKC Laboratories, Inc. • 110 N. Olinda Place • Brea, CA 92823 • 714 993-6112

Customer: **HITEM**
 Specification: **ITU-R 55/1**
 Work Order #: **95696** Date: 11/13/2014
 Test Type: **Band Edge compliance**
 Equipment: 2.4 GHz transmitter module
 Manufacturer: HITEM Tested By: S. Yamamoto
 Model: Skybell
 S/N: (none)

Test Equipment:

Asset #	Description	Model	Calibration Date	Cal Due Date
00787	Preamp	83017A	5/31/2013	5/31/2015
01646	Horn Antenna	3115	3/18/2014	3/18/2016
02869	Spectrum Analyzer	E4440A	7/10/2014	7/10/2015
P04382	Cable	LDF-50	7/30/2014	7/30/2016
P06360	Cable	L1-PNMNM-48	7/29/2014	7/29/2016
P06544	Cable	32026-29094K-29094K-36TC	11/20/2013	11/20/2015

Equipment Under Test (* = EUT):

Function	Manufacturer	Model #	S/N
2.4 GHz transmitter module*	HITEM	Skybell	(none)

Support Devices:

Function	Manufacturer	Model #	S/N
Laptop Computer	Averatec	5100 Series	NA
Power Supply	Jentec Technology Co., LTD.	AF1805-A	LF4R01082201507
Wireless Test Fixture	HITEM	Generic	Generic
Power Supply	LITEON	PA-1600-05	3600324901

Test Conditions / Notes:

The equipment under test (EUT) is a wireless module which is installed in the test fixture. The external antenna is connected to an antenna port. The EUT is connected to a remotely located laptop computer via a USB cable. The computer is running software Production Test GUI to setup EUT transmitting protocol.

The test frequencies are 2412MHz, 2442MHz, and 2472MHz.

An external DC power adapter is also connected to the wireless test fixture.

Frequency range of measurement, 2400MHz to 2483.5MHz.

Temperature: 20°C

Relative Humidity: 35%

Pressure: 100kPa

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of $k=2$.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $\text{dB}\mu\text{V}/\text{m}$, the spectrum analyzer reading in $\text{dB}\mu\text{V}$ was corrected by using the following formula. This reading was then compared to the applicable specification limit.

SAMPLE CALCULATIONS		
	Meter reading	(dBμV)
+	Antenna Factor	(dB)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dBμV/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
