4.10. Frequency Stability

TEST CONFIGURATION

TEST PROCEDURE

- The EUT was directly connected to the spectrum analyzer and antenna output port
- Spectrum setting as follows:
 RBW=10KHz
 VBW=30KHz
 Span= Entire absence of modulation emissionsbandwidth
 Sweep Time= Auto
 Attenuation= Auto
- The test extreme voltage is to change the primary supply voltage from 85 to 115 percent of the nominal value.
- User manual temperature is -10°C~55°C.

LIMIT

Frequency Range (MHz)	Limit
5150-5250	Specified in the user's manual

4.11. Antenna Requirement

Standard Applicable

For intentional device, according to FCC 47 CFR Section 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

And according to FCC 47 CFR Section 15.407 (a), if transmitting antennas of directional gain greater than 6dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6dBi.

Refer to statement below for compliance.

The manufacturer may design the unit so that the user can replace a broken antenna, but the use of a standard antenna jack or electrical connector is prohibited. Further, this requirement does not apply to intentional radiators that must be professionally installed.

Measurement

The antenna gain of the complete system is calculated by the difference of radiated power in EIRP and the conducted power of the module. For normal WLAN devices, the IEEE 802.11a mode is used.

Measurement parameters
