3. TEST TYPES AND RESULTS

3.1 OCCUPIED BANDWIDTH

3.1.1 LIMIT OF OCCUPIED BANDWIDTH

The OBW is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission.

3.1.2 TEST PROCEDURES

1.FOR 99 PERCENT OCCUPIED BANDWIDTH

2.The following procedure shall be used for measuring (99 %) power bandwidth:

3. Set center frequency to the nominal EUT channel center frequency.

4.Set span = 1.5 times to 5.0 times the OBW.

5. Set RBW = 1 % to 5 % of the OBW

6. Set VBW $\geq 3 \cdot$ RBW

7. Video averaging is not permitted. Where practical, a sample detection and single sweep mode shall be used. Otherwise, peak detection and max hold mode (until the trace stabilizes) shall be used.

8. Use the 99 % power bandwidth function of the instrument (if available).

9. If the instrument does not have a 99 % power bandwidth function, the trace data points are recovered and directly summed in power units. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5 % of the total is reached; that frequency is recorded as the lower frequency. The process is repeated until 99.5 % of the total is reached; that frequency is recorded as the upper frequency. The 99% occupied bandwidth is the difference between these two frequencies.

10.FOR 26dB BANDWIDTH

11.Set RBW = approximately 1% of the emission bandwidth.

12.Set the VBW > RBW.

13.Detector = Peak.

14. Trace mode = max hold.

15.Measure the maximum width of the emission that is 26 dB down from the peak of the emission.

Compare this with the RBW setting of the analyzer. Readjust RBW and repeat measurement as needed until the RBW/EBW ratio is approximately 1%.

3.2.2 TEST PROCEDURES

According to requirements of 511808 D01 C-V2X Waiver v01, RSU Transmit Power Test Procedures :

- a. A roadside unit (RSU) employing C-V2X technologies shall have a maximum transmit power not to exceed the EIRP provided in the relevant waiver grant. Compliance with the EIRP limit may be demonstrated for the RSU using conducted power measurements in conjunction with the antenna data sheet or antenna pattern measurements. The test procedures outlined in ANSI C63.26-2015 section 5.2 are generally applicable and may be used to demonstrate compliance for the RSU.
- b. Limits for OBUs and RSUs are in terms of an AVERAGE detector.

3.2.3 TEST SETUP

For the actual test configuration, please refer to the attached file (Test Setup Photo).

3.3 EMISSIONS MASK

3.3.1 LIMITS

C-V2X Out-of-Band Emissions (OOBE) Limits

Frequency Offset (MHz from Channel Edge)	OOBE EIRP Limits for C-V2X Transmissions (dBm/100 kHz)**
0.0	-16.0
1.0	-22.0
10.0	-30.0
20.0	-40.0

3.3.2 TEST PROCEDURE

According to requirements 511808 D01 C-V2X Waiver v01, An illustration of an emissions mask that may be applicable to RSUs and OBUs can be found in Figure 2.

a. Mask Test Procedure

1. Connect output of the antenna port to a spectrum analyzer or EMI receiver, with appropriate attenuation, as to not damage the instrumentation.
2. Set the reference level of the measuring equipment in accordance with procedure 4.1.5.2 of ANSI 63.10-2013.
3. Measure the 99% occupied bandwidth (OBW) using proper test procedures. This will be used to determine the channel edge.
4. Measure the power spectral density of the channel using the following procedure:
5. Set instrument center frequency to the frequency of channel being measured.
6. Set the span to at least 4 times the OBW.
7. Set resolution bandwidth (RBW) = 100 kHz.
8. Set video bandwidth (VBW) = 30 kHz
9. Number of points in sweep $\geq [2 \times \text{span} / \text{RBW}]$.
10. Sweep time = auto.
11. Detector = Peak
12. Trace mode = max hold.
13. Allow trace to fully stabilize.
14. In the case of devices which use multiple-input multiple-output (MIMO) technology, please follow the guidance in 662911 D01 Multiple Transmitter Output v02r01 E) 2) methods a) or c).
15. Use the instrumentation correction factors to account for cable loss and antenna gain since the final result is PSD EIRP. In the case of MIMO devices, please follow the guidance of 662911 D03 MIMO Antenna Gain Measurement v01 in determining aggregate antenna gain.

b. For the purposes of developing the emissions mask, the channel edge is defined as the offset from the frequency center (F_c) by $\pm \text{OBW}/2$. Keep in mind, the emissions mask is based upon an absolute EIRP value in dBm/100 kHz and not a relative change in amplitude (dBr). Therefore, it is not necessary to adjust the reference level so that the

crest of the channel touches the top of the emissions mask. Using the measuring equipment limit line function, develop the emissions mask based on the emissions limits at the frequency offsets specified in the relevant waiver grant. For example, Figure 2 illustrates the emissions mask for the emissions levels at the frequency offsets described below:

1. The top of the mask is the 99% OBW with an emissions level of -16 dBm/100 kHz.
2. +f1 and -f1 is a frequency offset of 1 MHz from the channel edge with an emissions level of -22 dBm/100 kHz.
3. +f2 and -f2 is a frequency offset of 10 MHz from the channel edge with an emissions level of -30 dBm/100 kHz.
4. +f3 and -f3 is a frequency offset of 20 MHz from the channel edge with an emissions level of -40 dBm/100 kHz.

3.3.3 TEST SETUP

Step 1:

- Connect the DUT transmitter output to the test setup and activate normal operation at maximum output power.

Step 2:

- Measure the average power in the transmission bandwidth ($f_c \pm 4,5$ MHz) using a resolution bandwidth of 100 kHz. This shall be recorded as the "Power Spectral Density at the carrier centre frequency f_c " according to Table 6.

Step 3:

- Measure the power level in the range of $f_c \pm 15$ MHz with a resolution bandwidth of 100 kHz and record these values.
- The video signal of the spectrum analyser can be "gated" such that the spectrum measured is measured $4,0 \mu s$ before the beginning of the transmission to $4,0 \mu s$ after the end of the transmission.
