TÜV SÜD Certification and Testing (China) Co., Ltd. Shenzhen Branch is a subcontractor to TÜV SÜD Product Service GmbH according to the principles outlined in ISO 17025.

TÜV SÜD Certification and Testing (China) Co., Ltd. Shenzhen Branch reports apply only to the specific samples tested under stated test conditions. Construction of the actual test samples has been documented. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. The manufacturer/importer is responsible to the Competent Authorities in Europe for any modifications made to the production units which result in non-compliance to the relevant regulations. TÜV SÜD Certification and Testing (China) Co., Ltd. Shenzhen Branch shall have no liability for any deductions, inferences or generalizations drawn by the client or others from TÜV SÜD Certification and Testing (China) Co., Ltd. Shenzhen Branch issued reports.

This report is the confidential property of the client. As a mutual protection to our clients, the public and ourselves, extracts from the test report shall not be reproduced except in full without our written approval

3 Description of the Equipment Under Test

Product:	Wireless Remote Control
Model no.:	50126-R
FCC ID:	2AENI-50126R
IC:	20144-50126R
Brand Name:	Woods
Options and accessories:	NIL
Rating:	DC 3.0V by CR2032 Batteries
RF Transmission Frequency:	433.92MHz
Modulation:	OOK
Antenna gain:	1.0dBi
Antenna Type:	PCB
Description of the EUT:	The Equipment Under Test (EUT) is a Remote Control operated at 433.92MHz

4 Summary of Test Standards

Test Standards	
FCC Part 15 Subpart C 10-1-2018 Edition	PART 15 - RADIO FREQUENCY DEVICES Subpart C - Intentional Radiators

8 Test Methodology

8.1 Radiated Emission

The sample was placed 0.8m above the ground plane on a standard emission test site *. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages.

*On a standard emission test site with a metal ground plane filed with the FCC pursuant to section 2.948 of the FCC rules.

8.2 Field Strength Calculation

The field strength at 3 m was established by adding the meter reading of the spectrum analyser to the factors associated with antenna correction factor, cable loss, preamplifiers and filter attenuation.

The equation is expressed as follow:

$$FS = R + \text{System Factor}$$
$$\text{System Factor} = AF + CF + FA - PA$$

Where FS = Net Field Strength in dBuV/m at 3 meters.

R = Reading of Spectrum Analyzer / Test Receiver in dBμV.

AF = Antenna Factor in dB.

CF = Cable Attenuation Factor in dB.

FA = Filter Attenuation Factor in dB.

PA = Preamplifier Factor in dB.

FA and PA are only be used for the measuring frequency above 1 GHz.

Remark:

-Refer to section 10.4 for average factor calculation.

Limits for Fundamental Frequency: [Section 15.231(b) and RSS-210 Table A1]:

Fundamental Frequency [MHz]	Field Strength of Fundamental [μV/m]	Field Strength of Fundamental [dBμV/m]
433.92	10996.67	80.83

Compliance with the limits in the above table may be based on the use of measurement instrumentation with a average detector.

10.2 Spurious Radiated Emission

Test Requirement:	FCC part 15 section 15.231(b)/RSS-210 A1.4(d)
Mode of Operation:	Transmitting mode.
Detector Function	Quasi-peak (Below 1000 MHz) Average and Peak (Above 1000 MHz)
Measurement BW	120 kHz (Below 1000 MHz) 1 MHz (Above 1000 MHz)

Results: PASS

3037.375000	H	50.45	-9.68	40.77	60.83	80.83

Note: No further spurious emissions found between 30 MHz and lowest internal used/generated frequency.

Remark:

- Refer to section 10.4 for average factor calculation.

Limits for Radiated Emission [Section 15.231(b) and RS 210 Table A1]:

Fundamental Frequency [MHz]	Field Strength of Spurious Emission [$\mu\text{V/m}$]	Field Strength of Spurious Emission [dB $\mu\text{V/m}$]
433.92	1099.67	60.83

Spurious emissions shall be attenuated to the average (or, alternatively, CISPR quasi-peak) limits shown in this table .

10.3 Bandwidth Measurement

Test Requirement:	FCC part 15 section 15.231 (c)/RSS-210 A1.3
Mode of Operation:	Transmitting mode.
Detector Function:	Peak

Results: PASS

Refer to the data graph, bandwidth of the emission is 146.20KHz, and is 0.071% of the centre frequency. Therefore, the EUT meets the requirement of section 15.231(c).

Limit for Bandwidth [Section 15.231 (c) and RSS-210 A.1.3]

The bandwidth of the emission shall be no wider than 0.25% if the centre frequency for devices operating above 70MHz and below 900MHz.

Test Result: Result data graph is shown in the following for reference.

10.4 Average Factor

Average factor in dB = $20 \log (\text{duty cycle})$

When the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the specification for output field strengths in accordance with the FCC rules specify measurements with an average detector.

The duty cycle is the total signal on time per one transmission.

The duration of one cycle = 33.6522ms

Effective period of the cycle = $(0.3043\text{ms} \times 19 + 0.5217 \times 3 + 0.7391 \times 5)$

= 11.0423ms

Duty cycle = $11.0423/33.6522 \times 100\% = 32.81\%$

Therefore, the averaging factor is $20 \log (0.3281)$
= -9.68dB

10.5 Transmitter Time

Test Requirement:	FCC part 15 section 15.231 (a)/RSS-210 A1.1(a)
Mode of Operation:	Transmitting mode.
Detector Function:	Peak

Results: PASS

According to FCC Part 15.231 (a), the transmitter shall be complied the following requirements:

- (1) A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.
- (2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.
- (3) Periodic transmissions at regular predetermined intervals are not permitted. However, polling or supervision transmissions, including data, to determine system integrity of transmitters used in security or safety applications are allowed if the total duration of transmissions does not exceed more than two seconds per hour for each transmitter. There is no limit on the number of individual transmissions, provided the total transmission time does not exceed two seconds per hour.

Limit for Transmitter Time [Section 15.231 (a)(1) and RSS-210 A1.1]

A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

Test Result: The Transmitter Time is 391.3ms
