1 General Information

1.1 Purpose of this Report

This report is prepared as a means of conveying test results and information concerning the suitability of this exact product for public distribution according to the FCC Rules and Regulations Part 15, Section 509, 521, 525 and based on the FCC Waiver docket DA 17-207, released March 1, 2017.

1.2 Characterization of Test Sample

The sample used for testing was received by US Tech on Aug 25, 2016 and May 18, 2017 in good operating condition.

1.3 Product Description

The Equipment under Test (EUT) is the Headsight, Inc. Terrahawk, Model Number HT5200. The EUT is a DC powered, non-contact radar height sensor used exclusively on mobile agricultural equipment to determine the distance between the ground and mounting position. The EUT is normally mounted between 1 inch and 12 feet above the ground and during operation is always positioned to emit towards the ground. There is no data port on the EUT.

Frequency of operation: 1.510 Ghz to 6.425 Ghz

Center Frequency: 3.9675 Ghz

Maximum Radiated Emission Frequency: 5.209 Ghz

Number of channels: 1 ch

Antenna Type: FlatEarth Planar Modified Bowtie Antenna

Antenna Gain: 4 to 6.0 dBi

Firmware version: Onyx3.29a

Note: Multiple Terrahawk transmitters intended to be mounted on a single piece of agricultural equipment shall be positioned for operation with a minimum separation distance of 1.5 m between transmitters. Due to capability, per FCC advice, the EUT was tested in both a single configuration and a multiple (dual) configuration, where the two EUT were separated by 1.5 m from each other.

1.4 Configuration of Tested System

The Test Sample was tested per *ANSI C63.10:2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices (2013)* and per FCC Part 15 Subpart F.

A list of EUT and Peripherals is found in Table 1 below. A block diagram of the tested system is shown in Figure 1. Test configuration photographs are provided in separate Appendices.

1.5 Test Facility

Testing was performed at US Tech's measurement facility at 3505 Francis Circle, Alpharetta, GA30004. This site has been fully described and registered with the FCC, with designation number 186022.

1.6 Related Submittals

The EUT is subject to the following FCC authorizations:

- a) Certification under section 15.509 as a transmitter.
- b) Verification under 15.101 as a digital device and receiver.

The Verification requirement shares many common report elements with the Certification report. Therefore the data presented in this report shall also be used to show compliance with the Verification requirements of Part 15.107 & 15.109.

2.2 Modifications to EUT Hardware

No physical modifications were made by US Tech in order to bring the EUT into compliance with FCC Part 15, Subpart F Intentional Radiator Limits for the transmitter portion of the EUT.

2.3 Frequency Range of Radiated Measurements (Part 15.33, 15.521(h))

2.3.1 Intentional Radiator

The spectrum shall be investigated for the intentional radiator from the lowest RF signal generated in the EUT, without going below 9 kHz to the 5th harmonic of the peak level of fundamental frequency generated or 40 GHz, whichever is the lowest.

The highest frequency used to determine the frequency range over which measurements are made shall be based on the center frequency (fc). If the center frequency is less than 10 GHz there is no requirement to measure beyond 40 GHz.

2.4 Measurement Detector Function and Bandwidth (CFR 15.35)

The radiated and conducted emissions limits shown herein are based on the following:

FCC Part 15.207, 15.209, 15.509

2.4.1 Detector Function and Associated Bandwidth

On frequencies below 1000 MHz, the limits herein are based upon measurement equipment employing a CISPR Quasi-peak detector function and related measurement bandwidths (i.e. 9 kHz from 150 kHz to 30 MHz and 120 kHz from 30 MHz to 1000 MHz). Alternatively, measurements may be made with equipment employing a peak detector function as long as the same bandwidths specified for the Quasi-peak device are used.

2.4.2 Corresponding Peak and Average Requirements

Above 1000 MHz, radiated limits are based on measuring instrumentation employing an average detector function. When average radiated emissions are specified there is also a corresponding Peak requirement, as measured using a peak detector, of 20 dB greater than the average limit. For all measurements above 1000 MHz the Resolution Bandwidth shall be at least 1 MHz.

2.5 EUT Antenna Requirements (CFR 15.203)

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. Only the antenna(s) listed in Table 4 will be used with this module.

Table 3. Allowed Antenna(s)

REPORT REFERENCE	MANUFACTURER	TYPE OF ANTENNA	MODEL	GAIN dBi	TYPE OF CONNECTOR
Antenna	Flat Earth, Inc	Bowtie	BT6100	4.0 to 6.0dBi	Internally connected

Figure 1. Block Diagram of Test Configuration

Note: EUT was tested in both single and dual configurations.

2.6 Restricted Bands of Operation (Part 15.205)

Only spurious emissions can fall in the frequency bands of CFR 15.205. The field strength of these spurious cannot exceed the limits of 15.209. Radiated harmonics and other Spurious are examined for this requirement see paragraph 2.1

2.7 Intentional Radiator, Power Line Conducted Emissions (CFR 15.207)

The EUT is battery powered. The EUT is indirectly connected the AC mains for testing purposes only. During normal operation the EUT is battery powered and will not be operated while directly or indirectly connected to the AC mains. This test was not applicable.

2.8 Intentional Radiator, Radiated Emissions (CFR 15.509 (f), 15.521 (g))

UWB devices where the highest radiated emission, f_M (The frequency at which the highest radiated emission occurs), is above 960 MHz have a limit on the peak level of the emission within a 50 MHz bandwidth of 0 dBm EIRP. A different RBW was used, therefore the peak emissions limit was adjusted per CFR 15.521 (g). The limit was also converted to peak field strength at 3 meters.

The antenna was positioned as it would be in normal operation and the fundamental emission was maximized to ensure the maximum reading and measured with the receiving antenna in both horizontal and vertical position. Below is the measured peak radiated emission at 3 meters.

RBW used: 1 MHz

$$\begin{aligned}\text{Peak EIRP Limit} &= 20 \log (\text{RBW}/50) \text{dBm EIRP} \\ &= 20 \log (1/50) \text{ dBm EIRP} \\ &= -33.97 \text{dBm EIRP}\end{aligned}$$

$$\begin{aligned}\text{Peak Field Strength Limit} &= -33.97 \text{dBm EIRP} + 95.2 \\ &= 61.22 \text{dBuV/m}\end{aligned}$$

Name: George Yang

2.8.1 Pulse Repetition Frequency and Duty Cycle

The device employs pulse modulation and has a repetition rate of 41.66 Hz. The pulse signal has been verified below.

Pulse Rate: 41.66 Hz

Period= 24 mSec

Frequency= 1/seconds= 1/0.024 secs = 41.66 Hz

Duty Cycle correction factor: -13.6 dB

$20 \log (TX_{on}/TX_{on}+TX_{off}) = 20 \log (5ms/24ms) = -13.6 \text{ dB}$

Figure 2. Pulse Repetition Frequency

Figure 3. TX on Period

2.9 UWB bandwidth (CFR 15.509 (a), 15.521(e))

The bandwidth of an imaging system under 15.509 must be below 10.6 GHz. The bandwidth is defined as the frequency band bounded by the points that are 10 db below the highest radiated emissions, as based on the complete transmission system including the antenna. The upper boundary is designated f_H and the lower boundary is designated f_L . The frequency at which the highest radiated emission occurs is designated f_M . If multiple bandwidths occur, then the maximum bandwidth is used.

The bandwidth was determined from a radiated measurement using the designated antenna with which EUT will operate in the final product. The receiving antenna's height was repeatedly varied from 1 m to 4 m and the polarity was adjusted several times. The turn table on which the EUT was placed was also rotated several times. This ensured that the true bandwidth of the EUT was measured. Below is the measured UWB bandwidth with the receiving antenna horizontal and vertical. Both polarities met the 10.6 GHz limit.

Emissions are contained within 1.510 GHz to 6.425 GHz which is below 10.6 GHz.

Figure 5. UWB 99% and -10dBBandwidth

The EUT has a fractional bandwidth of > 0.20 when calculated using the formula referenced in 15.503(c): $2(F_H - F_L) / (F_H + F_L) = 2(6.425 - 1.510 \text{ GHz}) / (6.425 + 1.510 \text{ GHz}) = 1.23, > 0.20$.

2.10 UWB Purpose, Part 90 License, and Coordination (CFR 15.509 (b))

The EUT, operating under CFR 15.509, is limited to GPR and wall imaging systems operating under the FCC Waiver agreement, DA 17-207, Waiver conditions. The details of the waiver conditions are included as a separate exhibit.

Based on the waiver, operation of this device shall be limited to parties eligible for licensing under the provisions of Part 90 of the Commission's rules (e.g. persons regularly involved in activities such as the operation of farms, ranches, or similar land areas, for the quantity production of crops or plants; including soil plowing, soil conditioning, seeding, fertilizing, or harvesting for agricultural activities. No operation in city gardens or on trees is permitted.

2.11 Remote Switch (CFR 15.509 (c))

A GPR that is designed to operate while being hand-held or a wall-imaging system must contain a manually operated switch or a remote switch that causes the transmitter to cease operation within 10 seconds of being released.

Since the EUT is not hand-held, and is not a wall-imaging system, it is exempt from this requirement.

2.12 Unintentional Radiator, Power line Emissions (CFR 15.207, 15.521 (j))

This EUT will not have access to the AC Main power line; therefore this requirement is not applicable.

2.13 Radiated Emissions at or Below 960 MHz (CFR 15.509 (d), 15.209)

The radiated emissions at or below 960 MHz from the transmitter shall not exceed the emissions levels in CFR 15.209. Furthermore the emissions due to the digital circuitry of the EUT must also comply with the limits for 15.209.

EUT was tested in single configuration and with dual configuration. The test results show that there are negligible differences between having a single configuration or dual configuration. The test results for dual configuration have been selected and presented here as a representative case.

The worst-case radiated emission for the EUT in the range of below 960 MHz was 0.8 dB below the limit at 74.52 MHz at a test height of 2m. All other radiated emissions were at least 2.9dB below the limits. This data can be found in the tables below.

2.14 Radiated Emissions above 960 MHz (CFR 15.509 (d), 15.521(d,g,h), 15.209)

The radiated emissions above 960 MHz from the transmitter shall comply with the AVG limits in Table 5 when measured using a resolution bandwidth of 1 MHz. The following are the worst case emissions with the receiving antenna in both horizontal and vertical polarities. The emissions were maximized using a Peak Detector, and the final measurement was taken using an Average Detector.

Table 9. Radiated Emissions above 960 MHz, CFR 15.509 (d), 15.521(g)

Frequency Range (MHz)	EIRP Limit (dBm)	Field Strength Limit at 3 meters (dBuV/m)
960 -1610	-65.3	30.0
1610 – 1990	-53.3	42.0
1990 – 3100	-51.3	44.0
3100 - 10600	-41.3	54.0
Above 10600	-51.3	44.0

EUT was tested in single configuration and with dual configuration. The test results show that there are negligible differences between having a single configuration or dual configuration. The test results for dual configuration have been selected and presented here as a representative case.

The worst-case radiated emission for the EUT in the range above 960 MHz was 1.5 dB below the limit at 2034.40 MHz at a test height of 2m. All other radiated emissions were at least 1.6dB below the CFR 15.509 limits. This data can be found in the table below.

2.15 Radiated Emissions in the GPS band (CFR 15.509 (e), 15.521(g))

In addition to the radiated emissions limits from CFR 15.509 (d), the transmitter shall not exceed the following average limits, in Table 8 when measured using a resolution bandwidth of no less than 1 kHz.

Note: measurement taken with a resolution bandwidth of greater than 1 kHz was corrected using the following equation: recorded measurement (dBuV) + 10 log (RBW_{ref}/RBW_{meas})

Table 14. Radiated Emissions in the GPS band (CFR 15.509 (e), 15.221(g))

Frequency Range (MHz)	EIRP Limit (dBm)	Field Strength Limit at 3 meters (dBuV/m)
1164-1240	-75.3	19.9
1559-1610	-75.3	19.9

The EUT was configured according to ANSI C63.10, Clause 10. During the testing the EUT was rated 360 degrees and the receive antenna was elevated between 1m and 4m to measure and record the maximum emissions being generated by the EUT. The receive antenna was oriented in both the horizontal and vertical polarity. The worst case data is recorded and presented in the tables below.

In each of these bands, the emissions from the transmitter were maximized using a larger bandwidth and the peak detector, then the resolution bandwidth was decreased and the final measurement was taken using the average detector. The spectrum analyzer settings were set to the following parameters:

Frequency start and stop: 1164 MHz to 1240 MHz and 1559 MHz to 1610 MHz. The resolution bandwidth was set to 1 kHz or 3 kHz, when the measurements were performed at 3 kHz a correction factor was used to correct the data collected at 3 kHz back to 1 kHz using the equation noted in the paragraph above. The video bandwidth was set to greater than or equal to the resolution bandwidth. The detector used was Peak or Average. The worse case emissions are seen below.

EUT was tested in single configuration and in dual configuration. The test results show that there are negligible differences between having a single configuration or dual configuration. The test results for dual configuration have been selected and presented here as a representative case.

The worst-case radiated emission for the EUT in the GPS band was 1.5 dB below the limit at 1600.00 MHz at a test height of 1m. All other radiated emissions were at least 2.6dB below the CFR 15.509 limits. This data can be found in the tables below.

Table 18. Worst Case Radiated Emissions Test Data In The GPS Bands @ 3.7m Dual Unit

1164 – 1240 MHz and 1559- 1610 MHz								
Test: Radiated Emissions					Client: Headsight, Inc.			
Project: 17-0097					Model: HT5200			
Frequency (MHz)	Test Data (dBuV)	Additional Factor	AF+CA-AMP (dB/m)	Results (dBuV/m)	AVG Limits (dBuV/m)	Antenna Distance/ Polarization	Margin (dB)	Detector PK, or AVG
1600.06	35.59	-4.70	-21.08	9.81	19.9	3.0m./VERT	10.1	PK
1199.91	43.05	-4.70	-21.71	16.64	19.9	3.0m./HORZ	3.3	PK
1199.91	36.84	-4.70	-21.55	10.59	19.9	3.0m./VERT	9.3	PK
1600.06	31.35	-4.70	-21.09	5.57	19.9	3.0m./HORZ	14.3	PK

Note: measurements collected with a RBW of 3 kHz therefore a correction factor was applied in the additional factor column.

Note: A duty cycle correction factor of -13.6 dB was included in the AF+CA-AMP column to correct from PK to AVG detection.

Sample Calculation at 1600.06 MHz:

Magnitude of Measured Frequency	35.59 dBuV
+Additional Factor	-4.70 dB
+Antenna Factor + Cable Loss+ Amplifier Gain	-21.08 dB/m
Corrected Result	9.81 dBuV/m

Test Date: May 18, 2017

2.16 Measurement Uncertainty

The measurement uncertainties given were calculated using the method detailed in CISPR 16-4. A coverage factor of $k=2$ was used to give a level of confidence of approximately 95%.

2.16.1 Conducted Emissions Measurement Uncertainty

Measurement Uncertainty (within a 95% confidence level) for this test is $\pm 2.78\text{dB}$.

This test is not applicable.

2.16.2 Radiated Emissions Measurement Uncertainty

For a measurement distance of 3 m the measurement uncertainty (with a 95% confidence level) for this test using a Biconical Antenna (30 MHz to 200 MHz) is $\pm 5.39\text{dB}$. This value includes all elements of measurement.

The measurement uncertainty (with a 95% confidence level) for this test using a Log Periodic Antenna (200 MHz to 1000 MHz) is $\pm 5.18\text{dB}$.

The measurement uncertainty (with a 95% confidence level) for this test using a Horn Antenna is $\pm 5.21\text{dB}$.

The data listed in this test report does not have sufficient margin to negate the effects of uncertainty. Therefore, the EUT conditionally meets this requirement.
