1. INTRODUCTION

This document presents the result of RADIO test carried out on the following equipment: **Wirnet iFemtoCell 915** in accordance with normative reference.

The product is a LoRa gateway composed by a LoRa function not certified and a Wi-Fi 2.4 GHz module already certified.

This radio test report concern only the test realized in order to certify the LoRa function, CFR47 FCC subpart C (§15.247).

The tests realized for subpart B (Wi-Fi integration and LoRa reception) or collocation measure are reported in radio test report RR051-17-100994-3-A.

2. PRODUCT DESCRIPTION

Class: B

Utilization: Residential use

Antenna type and gain: External antenna, connector RP-SMA and gain 3dBi (TEKFUN_I50-SR-W)

Modulation: LoRa

Power source: 120 Vac – 60 Hz by AC/DC adapter

During test the output power was adjusted at the maximal level with the following setting (Mix 15 Pa 3)

Power level, frequency range and channels characteristics are not user adjustable.
The details pictures of the product and the circuit boards are joined with this file.

3. **NORMATIVE REFERENCE**

The standards and testing methods related throughout this report are those listed below.

They are applied on the whole test report even though the extensions (version, date and amendment) are not repeated.

NAP: Not Applicable

NAs: Not Asked

Note 1: dedicated antenna with RP-SMA connector.

Note 2: See FCC part 15.247 (d).

Note 3: Single modular transmitter (Wi-Fi module).

The host devices of the certified modules shall be properly labeled to identify the modules within.

Note 4: See FCC part 15.209. Unwanted emissions levels are all below the fundamental emission field strength level.

Note 5: The minimum 6 dB bandwidth of the equipment is 563 kHz (see appendix 4).

RF EXPOSURE:

MPE

Maximum measured conducted power = 27.15 dBm
EIRP with 3 dBi antenna gain = 30.15 dBm = 1035.1 mW

In accordance with KDB 447498 D01 General RF Exposure Guidance v06:

$$PSD = EIRP / (4 * \pi * R^2)$$

$$\Rightarrow 1035.1 / (4 * \pi * (20 \text{ cm})^2) = 0.206 \text{ mW/cm}^2 \text{ (limit= } 0.617 \text{ mW/cm}^2 \text{)}$$

The equipment fulfils the requirements on power density for general population/uncontrolled exposure and therefore fulfils the requirements of 47 CFR §1.1310.

7. MEASUREMENT UNCERTAINTY

To declare, or not, the compliance with the specifications, it was not explicitly taken into account of uncertainty associated with the results.

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k=2$, which for normal distribution corresponds to a coverage probability of approximately 95%.

Parameter	Emitech Uncertainty
RF power, conducted	$\pm 0.75\text{dB}$
Radiated emission valid to 26 GHz	
F < 62.5 MHz:	$\pm 5.14\text{ dB}$
62.5 MHz < F < 1 GHz:	$\pm 5.13\text{ dB}$

The EUT is isolated and placed on a wooden table, 0.8 m over a horizontal reference plane and 0.4 m from a vertical reference plane. It is powered by an artificial main network placed on the ground reference plane. The equipment is powered with the AC power operating voltage of 120 V / 60 Hz.

See photos in appendix 2

Frequency range: 150 kHz - 30 MHz**Detection mode:** Peak / Quasi-peak / Average**Bandwidth:** 10 kHz / 9 kHz**Equipment under test operating condition:**

The equipment under test is blocked in continuous modulated transmission mode, at the highest output power level at which the transmitter is intended to operate. The measure is repeated for maximal and minimal SF used on central channel.

During this measure the WiFi module is also blocked in emission at central channel

Results:

Sample N° 1: SF 7 at 925.1 MHz

Measurement on the mains power supply:

The measurement is first realized with Peak detector.

Curve N° 1: measurement on the Neutral with peak detector

Curve N° 2: measurement on the Line with peak detector

Only the frequencies which are not 6 dB under the Quasi-peak limit are then analyzed with Quasi-peak detector.
Only the frequencies which are not 6 dB under the Average limit are then analyzed with Average detector.

Sample N° 1: SF 12 at 925.1 MHz

Measurement on the mains power supply:

The measurement is first realized with Peak detector.

Curve N° 3: measurement on the Neutral with peak detector

Curve N° 4: measurement on the Line with peak detector

Only the frequencies which are not 6 dB under the Quasi-peak limit are then analyzed with Quasi-peak detector.
Only the frequencies which are not 6 dB under the Average limit are then analyzed with Average detector.

Emissions in restricted frequency bands method of paragraph 12 of KDB 558074

Test set up:

First an exploratory radiated measurement was performed. During this phase the product is oriented in three orthogonal planes.

Then the final measurement is realized with the product on the most critical orientation.

The measure is realized on open area test site under 1 GHz and in anechoic chamber above 1 GHz.

When the system is tested in an open area test site (OATS), the EUT is placed on a rotating table, 0.8m from a ground plane.

When the system is tested in anechoic chamber, the EUT is placed on a rotating table, 1.5m from a ground plane.

Zero degree azimuths correspond to the front of the device under test.

See photos in appendix 2.

Applicable limits: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 30 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The highest level recorded in a 100 kHz bandwidth is 126.7 dB μ V/m on low channel .

So the applicable limit is 96.7 dB μ V/m.

In addition, radiated emissions which fall in the restricted band, as defined in section 15.205 (a), must also comply with the radiated emission limits specified in section 15.209 (a) (see section 15.205 (c)).

Note: any spurious which has more than 20 dB of margin compared to the applicable limit is not necessarily reported.

Applicable limits: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 30 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The highest level recorded in a 100 kHz bandwidth is 126.3 dB μ V/m on low channel .

So the applicable limit is 96.3 dB μ V/m.

In addition, radiated emissions which fall in the restricted band, as defined in section 15.205 (a), must also comply with the radiated emission limits specified in section 15.209 (a) (see section 15.205 (c)).

Note: any spurious which has more than 20 dB of margin compared to the applicable limit is not necessarily reported.

AVGPSD-1 of paragraph 10.3 of KDB 558074**Test set up:**

The measure is realized in conducted mode and the PSD is measured with a spectrum analyser.

Span: 1000 kHz

Resolution bandwidth: 3 kHz

Video bandwidth: 10 kHz

Detector: RMS

Number of points: 1000 ($> 2 \cdot \text{span} / \text{RBW} > 2 \cdot 1000 / 3$)

Trace averaging (RMS) mode is used over 100 (SF7) or 1000 traces (SF12).

Then the peak marker function is used.

Equipment under test operating condition:

The equipment under test is blocked in continuous transmission mode (duty cycle 100%), modulated by internal data signal, at the highest output power level which the transmitter is intended to operate and the measure is repeated with the Spread factor 7 and 12.

Maximum antenna gain used with the product is 3 dBi.
