

Difference Configuration Declaration

The P20R01 model comes in three versions:

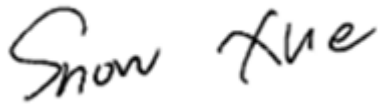

1.	Without external battery version	No external backup power function - the device will shut down immediately after the adapter is unplugged.
2.	super capacitor version	With built in super capacitor backup power function.
3.	With external battery version	With external battery backup power function - the device will continue to work as intended for several minutes after the adapter is unplugged. It's the same design with configuration 1, only add external battery.

The motherboard circuit design is identical across all versions; the only difference lies in whether the super capacitor and external battery are connected or not.
