Note 1: Integral antenna.

Note 2: See FCC part 15.247 (d).

Note 3: See FCC part 15.209. Unwanted emissions levels are all below the fundamental emission field strength level.

Note 4: Conducted measurement is not possible (integral antenna), so we used the radiated method in open field.

Note 5: The frequency hopping system uses 64 channels (see appendix 8).

Each frequency is used equally on the average time by the transmitter.

The timing by channel is 123ms (see appendix 7).

During $64 \text{ channels} \times 0.4 \text{ s} = 25.6 \text{ s}$, any channel is used 1 time, then $1 \times 123 \text{ ms} = 123 \text{ ms}$, thus the average time of occupancy on any channel is less than 400 ms within a period of 0.4 seconds multiplied by the number of hopping channels employed, in normal operating mode.

Number of channels	Observation period ($0.4 \text{ s} \times \text{Nbr of channel}$) (s)	Maximal Duration of each burst (ms)	Number of burst repetition during observation period	average time of occupancy on any channel (s)	Limits (s)
64	25.6	123	1	0.123	0.4

Note 6: The maximum 99% bandwidth of the equipment is 124.81 kHz (see appendix 4).

RF EXPOSURE:

Note 7 :

Maximum measured power = $90.4 \text{ dB}\mu\text{V/m} = 3.65 \text{ mW}$

With $P = (E_{\text{cd}})^2 / (30 \times G_p)$ with $d = 3 \text{ m}$ and $G_p = 1$

In accordance with KDB 447498 D01 General RF Exposure Guidance v05r02

$\text{PSD} = \text{EIRP} / (4 \times \pi \times R^2) = 3.65 / (4 \times \pi \times (20 \text{ cm})^2) = 0.000726 \text{ mW/cm}^2$ (limit= 0.6 mW/cm^2).

The equipment fulfils the requirements on power density for general population/uncontrolled exposure and therefore fulfils the requirements of 47 CFR §1.1310.

To declare, or not, the compliance with the specifications, it was not explicitly taken into account of uncertainty associated with the results

7. RADIATED EMISSION LIMITS

Standard: FCC Part 15

Test procedure: paragraph 109

Limit class: Class B

Test set up:

First an exploratory radiated measurement was performed. During this phase the product is oriented in three orthogonal planes.

Then the final measurement is realized with the product on the most critical orientation.

When the system is tested in an open area test site (OATS), the EUT is placed on a rotating table, 0.8m from a ground plane.

When the system is tested in anechoic chamber, the EUT is placed on a rotating table, 1.5m from a ground plane.

Zero degree azimuths correspond to the front of the device under test.

** the peak level is lower than the average limit (54 dB μ V/m).

Note: any spurious which has more than 20 dB of margin compared to the applicable limit is not necessarily reported.

Applicable limits: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The highest level recorded in a 100 kHz bandwidth is 100.8 dB μ V/m on high channel.

So the applicable limit is 80.8 dB μ V/m.

In addition, radiated emissions which fall in the restricted band, as defined in section 15.205 (a), must also comply with the radiated emission limits specified in section 15.209 (a) (see section 15.205 (c)).

11. PEAK POWER DENSITY

Standard: FCC Part 15

Test procedure: paragraph 15.247 (e)

Test set up:

First an exploratory radiated measurement was performed. During this phase the product is oriented in three orthogonal planes.

Then the final measurement is realized with the product on the most critical orientation.

The system is tested in an open area test site (OATS). The EUT is placed on a rotating table, 0.8m from a ground plane. Zero degree azimuths correspond to the front of the device under test.

The measurement of the electro-magnetic field is realized; with a resolution bandwidth adjusted at 3 kHz and video bandwidth at 10 kHz

The measuring distance between the equipment and the test antenna is 10 m. The test antenna has been oriented in two polarizations (Vertical and Horizontal) and raised and lowered from 1m to 4m above the ground level. Only the highest level of each measurement is reported.

We used the same method of the peak output power measurement, but the equipment under test power level is recorded with the spectrum analyzer.

Resolution bandwidth: 3 kHz

Video bandwidth: 10 kHz

Equipment under test operating condition:

The equipment under test is blocked in continuous modulated transmission mode, at the highest output power level at which the transmitter is intended to operate.
