GENERAL SUMMARY

Product Name	Mobile Phone
Model Name	Obi Worldphone SF1
Trade Name	OBI
Applicant	OBI Connect FZE
Manufacturer	CK Telecom Limited
Test Laboratory	GCCT, Guangdong Telecommunications Terminal Products Quality Supervision and Testing Center
Reference Standards	FCC CFR 47 Part 15C: "Radio Frequency Devices Sub-Part C: intentional Radiators" ANSI C63.10-2013, "American National Standard for Testing Unlicensed Wireless Devices" FCC Public Notice DA 00-705, "Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems"
Test Conclusion	This portable wireless equipment has been measured in all cases requested by the relevant standards. Test results in annex B of this test report are below limits specified in the relevant standards. General Judgment: Pass Date of issue: 2016.04.07
Comment	The test results in this report apply only to the tested sample of the stated device/equipment.

ANNEX B: Detailed Test Results

The radiated test setup is shown in each radiated test case section. The conducted test setup is shown as following:

All modes of operation and data rates were investigated. The test results shown in the following sections represent the worst case emissions.

B.1 Maximum Transmit Power

B.1.1 Description

According to §15.247(b)(1),

The maximum Peak Output power shall be equal to or less than $125\text{mW} \approx 21\text{dBm}$

B.1.2 Test procedures

Conducted Measurement

EUT was set for low, mid, high channel with modulated mode and highest RF output power

The spectrum analyzer was connected to the antenna terminal.

Procedures:

- Place the EUT on the table and set it in transmitting mode.
- RF output of EUT was connected to SA by a low loss cable.
- SA settings as follow: Span= approximately 5 times the 20 dB bandwidth, centered on a hopping channel, RBW $\geq$ the 20 dB bandwidth of the emission being measured, VBW $\geq$ RBW, Sweep time= auto, Detector function= Peak, Trace= Max hold
- Then set the EUT to transmit at low, middle and high frequency and measure the conducted output power separately

B.1.3 Test Results

Date rate (Mbps)	Maximum peak output power(dBm)			Verdict
	2402MHz	2441MHz	2480MHz	
1	7.051	8.098	7.313	Pass
2	8.480	8.124	8.362	Pass

B.2 20dB Bandwidth**B.2.1 Description**

According to §15.247(a)(1)(iii)

The bandwidth at 20 dBm down from the highest in-band spectral density is measured with a spectrum analyzer connected to the receiver antenna while the EUT is operating in transmission mode at the appropriate frequencies.

B.2.2 Test procedures

- a) Testing follows FCC Public Notice DA 00-705 Measurement Guidelines.
- b) RF output of EUT was connected to SA by a low loss cable.
- c) SA settings as follow: Span= approximately 2 to 3 times the 20 dB bandwidth, centered on a hopping channel, RBW $\geq$ 1% of 20 dB bandwidth, VBW $\geq$ RBW, Sweep time= auto, Detector function= Peak, Trace= Max hold
- d) Set the measured low, middle and high frequency and test 20dB bandwidth with spectrum analyzer

B.3 Band Edge Compliance

B.3.1 Conducted Measurement

B.3.1.1 Description

According to §15.247(d), the Band Edges Compliance shall be equal to or less than -20 dB.

B.3.1.2 Test procedures

Conducted Measurement

EUT was set for low, mid, high channel with modulated mode and highest RF output power

The spectrum analyzer was connected to the antenna terminal.

Standard Requirement

Emissions within 2 MHz of an authorized band edge may be measured using either the marker-delta method (for peak or average emissions) or the integration method (for average emissions only), described below, provided that the OBW edge falls within 2 MHz of the band edge. Otherwise, all unwanted emissions measurements shall be performed using the standard methods.

Procedures

Peak Detection

When using a peak detector to measure unwanted emissions at or near the band edge (within 2 MHz of the authorized band), the following integration procedure can be used.

- a) Set instrument center frequency to the frequency of the emission to be measured (must be within 2 MHz of the authorized band edge).
- b) Set span to 2 MHz
- c) RBW = 100 kHz.
- d) VBW $\geq 3 \times$ RBW.
- e) Detector = peak.
- f) Sweep time = auto.
- g) Trace mode = max hold.
- h) Allow sweep to continue until the trace stabilizes (required measurement time may increase for low duty cycle applications)
- i) Compute the power by integrating the spectrum over 1 MHz using the analyzer's bandpower measurement function with band limits set equal to the emission frequency ($f_{\text{emission}} \pm 0.5$ MHz). If the instrument does not have a band power function, then sum the amplitude levels (in power units) at 100 kHz intervals extending across the 1 MHz spectrum defined by $f_{\text{emission}} \pm 0.5$ MHz.

B.3.2 Radiated measurement

B.3.2.1 Procedures:

- Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- Position the EUT on the rotated table inside the anechoic chamber without connection to measurement instrument. Turn on the EUT and make it operate in transmitting mode. Then set it to Low Channel

and High Channel within its operating range, and make sure the instrument is operated in its linear range. Repeat above procedures until all measured frequencies were complete.

- Set band RBW=1MHz,VBW=3MHz with a convenient frequency span from band edge.
- Find the highest point in edge frequency,and then calculated results.
- Repeat above procedures until all measured frequencies were complete.

B.3.2.2 Test Results

Only the GFSK worst case were reported.

B.4 Carrier Frequency Separation

B.4.1 Description

According to §15.247(a)(1), Carrier Frequency Separation should be more than two-thirds of the 20 dB bandwidth of the hopping channel

B.4.2 Test Procedures

- Testing follows the guidelines in FCC Public Notice DA 00-705 Measurement Guidelines.
- Place the EUT on the table and set it in hopping mode
- EUT was connected to SA by a low loss cable.
- Set center frequency of spectrum analyzer=middle of hopping channel.
- SA setting: Span= wide enough to capture the peaks of two adjacent channels; Set $RBW \geq 1\%$ of span, $VBW \geq RBW$, sweep time- auto, detector function= peak, trace= max hold.
- Max hold, mark 2 peaks of hopping channel and record the 2 peaks frequency.

B.4.2 Test Results

The Worst case is 1M and only 1M results are present

Worst case data rate: 1M

B.5 Time Of Occupancy (Dwell Time)**B.5.1 Description**

According to §15.247(a)(1)(iii)

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

B.5.2 Test Procedures**Conducted Measurement**

EUT was set for low, mid, high channel with modulated mode and highest RF output power

The spectrum analyzer was connected to the antenna terminal.

Procedures

- a) Place the EUT on the table and set it in transmitting mode and switch on frequency hopping function.
- b) Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer.
- c) Set the spectrum analyzer as Span=zero span, centered on a hopping channel, RBW=1MHz, VBW $\geq$ RBW, Sweep=as necessary to capture the entire dwell time per hopping channel, Detector function=peak, Trace=max hold.
- d) Calculate the time of occupancy in a period with time occupancy of a burst and quantity of bursts.

B.6 Number of Channel Hopping

B.6.1 Description

According to §15.247(a)(1)(iii), Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels.

B.6.2 Test Procedures

Conducted Measurement

EUT was set for low, mid, high channel with modulated mode and highest RF output power

The spectrum analyzer was connected to the antenna terminal.

Procedures

- e) Place the EUT on the table and set it in transmitting mode and switch on frequency hopping function.
- f) Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer.
- g) Set the spectrum analyzer as Start=2400MHz, Stop=2483.5MHz, Span=the frequency band of operation, RBW $\geq$ 1% of the span, VBW $\geq$ RBW, Sweep=auto, Detector function=peak, Trace=max hold.
- h) Count the quantity of peaks to get the number of hopping channels.

B.7 Conducted Spurious Emissions**B.7.1 Description**

According to §15.247(d),

All harmonics/spurious must be at least 20 dB down from the highest emission level within the authorized band.

B.7.2 Test Procedures**Conducted Measurement**

EUT was set for low, mid, high channel with modulated mode and highest RF output power

The spectrum analyzer was connected to the antenna terminal.

Procedures

- a) The EUT was connected to SA by a low loss cable.
- b) Set RBW=100 kHz, VBW $\geq$ RBW, scan up to 10th harmonics. All harmonics/Spurs emissions must be at least 20 dB down from the highest emission level within the authorized band as measured with a 100 kHz RBW.

B.8 AC Conducted Emission

B.8.1 Description

For equipment that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits

B.8.2 Test Procedure

- a) The EUT was placed 0.4 meter from the conducting wall of the shielding room was kept at least 80 centimeters from any other grounded conducting surface.
- b) Connect EUT to the power mains through a line impedance stabilization network (LISN).
- c) All the support units are connecting to the other LISN.
- d) The LISN provides 50 ohm coupling impedance for the measuring instrument.
- e) The FCC states that a 50 ohm, 50 microhenry LISN should be used.
- f) Both sides of AC line were checked for maximum conducted interference.
- g) The frequency range from 150 kHz to 30 MHz was searched.
- h) Set the test-receiver system to Peak Detect Function and specified bandwidth with Maximum Hold Mode.

B.8.3 Test Setup

**B.8.4 Test Results****Limit**

B.9 Radiated Emission

B.9.1 Limit of Radiated Emission

In any 100 kHz bandwidth outside the intentional radiator frequency band, all harmonics/spurious must be at least 20dB below the highest emission level within the authorized band. In addition, radiated emissions which fall in the restricted bands must also comply with the FCC section 15.209 limits as below

Frequency(MHz)	Field Strength(microvolts/meters)	Measurement Distance(Meters)
0.009-0.490	2400/F(kHz)	3000
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30

30-88	100	3
88-216	150	3
216-960	200	3
above 960	500	3

B.9.2 Test Procedure

- The EUT was placed on a turntable with 1.5meter above ground.
- The EUT was set 3 meters from the interference receiving antenna, which was mounted on the top of a variable height antenna tower.
- The table was rotated 360 degrees to determine the position of the highest radiation.
- The height of the antenna is varied between one meter and four meters above ground to find the maximum value of the field strength for both horizontal polarization and vertical polarization of the antenna.
- For each suspected emission, the EUT was arranged to its worst case and then tune the antenna tower(from 1 m to 4 m)and turntable(from 0 degree to 360 degrees)to find the maximum reading.
- Set the test-receiver system to Peak Detect Function and specified bandwidth with Maximum Hold Mode. SA setting: Span= wide enough to fully capture the emission being measured; RBW=1MHz (f > 1GHz), RBW=100kHz (f < 1GHz), VBW ≥ RBW, Sweep time=auto, Trace= Max hold. Above 18GHz shall be extrapolated to specified distance using an extrapolation factor 20dB/decade from 3m to 1m.
- If the emission level of the EUT in peak mode was 20dB lower than the limit specified, then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions will be repeated one by one using the quasi-peak method and reported.
- Emission level (dBμV/m) = 20 log Emission level (μV/m).

B.9.3 Test Setup

Frequency Band(MHz)	Function	Resolution Bandwidth	Video Bandwidth
30 to 1000	QP	100kHz	100kHz
Above 1000	Peak	1MHz	1MHz
	Average	1MHz	10Hz

Radiated Emissions Frequency: Below 1GHz

Radiated Emissions Frequency: above 1GHz

B.9.4 Test Results

The low frequency, which started from 9kHz to 30MHz and the high frequency, which started from 18GHz

to 26GHz, were pre-scanned and which was 20dB lower than limit line per 15.31(0) were not reported.

Worst case data rate: 1M

Test Mode: Traffic

Verdict: Pass

Fig.69 Radiated Emission of channel 78 in 1GHz-6GHz

B.10 Antenna Requirements

B.10.1 Standard Applicable

If directional gain of transmitting antennas is greater than 6dBi, the power shall be reduced by the same level in dB comparing to gain minus 6dBi. The use of a permanently attached antenna or of an

antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the FCC rule.

B.10.2 Antenna Connected construction

The Antenna type used in this product is PIFA Antenna without connector and it is considered to meet antenna requirement.

B.10.3 Antenna Gain

The antenna peak gain of EUT is less than 6dBi, Therefore, it is not necessary to reduced maximum peak output power limit.
