4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

- Transmitting at maximum power using QPSK modulation with spreading factors 16, 32, 64, 128 and 256.
- Transmitting a CW tone during Radio Frequency Tolerance tests.
- Operating on bottom, middle and top channels with 2.5 MHz, 5 MHz and 10 MHz channel bandwidth.
- Operating in a test mode to allow continuous transmission.

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- A laptop computer was used to configure the EUT during testing using a browser based GUI. The laptop was connected to the IDU via Ethernet.
- The IDU and ODU were connected using an F type satellite coaxial cable provided by the customer.
- A test fixture (orthomode transducer) was supplied by the customer to adapt the circular waveguide flange at the EUT antenna port to rectangular flanges allowing the connection of test equipment. The maximum path loss of the test fixture was declared as 0.5 dB.
- Transmitter radiated spurious emissions tests were performed with the antenna port terminated into a 50 Ω load.

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to *Section 6. Measurement Uncertainty* for details.

In accordance with UKAS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

5.2. Test Results

5.2.1. Transmitter Power Spectral Density

Test Summary:

Test Engineer:	Ben Mercer	Test Dates:	02 December 2015 & 03 December 2015
Test Sample Serial Numbers:	311510061 & 3115155009		

FCC Reference:	Part 25.204(a)
Test Method Used:	FCC KDB 971168 Section 5.4.1

Environmental Conditions:

Temperature (°C):	24 to 25
Relative Humidity (%):	40 to 41

Note(s):

1. Transmitter Power Spectral Density tests were performed using a spectrum analyser in accordance with FCC KDB 971168 Section 5.4.1.
2. Part 25.204 specifies the spectral density requirement in a 4 kHz bandwidth. The closest selectable resolution bandwidth of 4.3 kHz was set, and video bandwidth was set to 13 kHz. An RMS detector was used, sweep time was set to auto and trace averaging was employed over 100 traces. The span was set to 2 times the authorised bandwidth. The number of measurement points was set to at least 2 x span / resolution bandwidth. A marker was placed at the peak of the signal and the results recorded in the tables below.
3. The spectrum analyser was connected to the antenna port on the EUT using suitable attenuation and coaxial cable. A reference level offset was entered on the spectrum analyser to compensate for the loss of the attenuator and coaxial cable.
4. The customer provided an OMT to adapt the circular waveguide flange at the antenna port to rectangular flanges to enable conducted measurements. The customer stated the worst case loss of the OMT as 0.5 dB. This loss was not known at the time of test, and has been added to the measured results in the tables below.

5.2.2. Transmitter Occupied Bandwidth (Bandwidth Limitations)**Test Summary:**

Test Engineer:	Ben Mercer	Test Date:	03 December 2015
Test Sample Serial Numbers:	311510061 & 3115155009		

FCC Reference:	Part 2.1049
Test Method Used:	FCC KDB 971168 Section 4.2

Environmental Conditions:

Temperature (°C):	25
Relative Humidity (%):	41

Note(s):

1. Occupied Bandwidth tests were performed using a spectrum analyser in accordance with FCC KDB 971168 Section 4.2.
2. The spectrum analyser resolution bandwidth was set to between 1% and 5% of the occupied bandwidth. The video bandwidth was set to at least 3 times the resolution bandwidth. The frequency span was set to five times the authorised bandwidth in order to capture all modulation products.
3. A max hold trace with peak detector was employed over 100 sweeps, and the 99% bandwidth function of the analyser was used to measure the occupied bandwidth.
