For a more detailed features description, please refer to the manufacturer's specifications or the user's manual.

1.2. Antenna Information

Ant No.	Brand	Model Name	Antenna Type	Connector	Gain (dBi)
1	N/A	N/A	Internal	N/A	0
2	N/A	N/A	Internal	N/A	0

Note:

- The EUT has two antennas, the antennas can support SISO function in IEEE 802.11b and IEEE 802.11g, and can support MIMO function in IEEE 802.11n.
- The EUT can work as CDD mode in IEEE 802.11n HT20 and IEEE 802.11n HT40, and can operate with one spatial stream.
- According to ANSI C63.10:2013 14.4.3.2.5 a):
 $\text{Directional gain} = 2\text{dBi} + 10 \times \log(2/1)\text{dB} = 5.01\text{dBi} < 6\text{dBi}$
 So, the output power limit and power spectral density do not need to be reduced.
- After pre-test all antenna configurations, the worst case configuration is listed below.

6. CONDUCTED BAND EDGE

6.1. Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

6.2. Test Setup

6.3. Spectrum Analyzer Setting
