

Operational Description

Before start up the device, a diagnostic is needed to see if the components are perfectly connected then a calibration of sensors: the user launch on the Controlserver the diagnostic program that verifies the connectivity of the parts after that he start the calibration program which test the alignment of the sensors and make the calibration.

The sensors are then fixed to the face and the tongue of the proband. In order to avoid any rauschen signal the proband is grounded.

A magnetic field is broadcast around the proband and now can the movement of the sensors be measured and recorded on the PC with special program.

For more accurate results the head movement during check-may be corrected with another program also delivered with the AG501.

AG501 Operation:

- The T9 Board controls the transmitter coils.
- The C Board defines the frequency for each coils
- The coils diffuse the magnetic feld
- The Sensin Board collects the sensors movements and converts them into an analog amplified signal.
- The Sybox record the Sound and synchronizes it with the movement
- The Encoder measures and controls the position of the motor
- The DSPcon Board is the main part of the system by which the signals are transmitted and received. This board contains all the connectors (except RJ45) for connecting the functional groups.
- The FPGA Board is the brain of the AG501, it contains the main program to control all electronics on the AG501

Assemblies

E.	Controlserver	19

A. E-Box

The main electronics of the Articulograph AG501 are located in the E-Box. The connection between different parts is shown in figure 1

1. HDMI cable (19 pol.) to Encoder in the Circal
2. Round shielded cable to the motor in the Circal (3 pol.)
3. Signal cable with D-subminiature connector (15 pol.) to the Sybox
4. Three Samtec V-Port cables to each Sensin Board.

Figure 1: Structure of the E-Box - the red frame shows the three boards in the E-box

1. DSPCon2 Board

The DSPCon2 board allows the connection between all modules.

Figure 2: DSPCon Board – the FPGA Board will be here plugged.

2. FPGA Board

Xilinx Embedded Development HW/SW Kit - Spartan-3A DSP S3D1800A
MicroBlaze Processor Edition
AVNET: HW SD 1800A DSP SB UNI-G

FPGA - Xilinx Device:
XC3SD1800A-4FGG676C Spartan-3A DSP FPGA

The main electronics and the Microblaze are located in the FPGA board

3. T9 Board

Electronics to control the nine transmission coils (Transmitter)

Figure 4: T9 Board with 9 SMA connectors

4. Power supply MPT-200C

Features

65,94 €

- Universal AC input / Full range
- Low leakage current <180µA
- Protections: Short circuit/Over load/Over voltage/Over temperature
- Free air convection for 140W and forced air convection for 200W
- UL2601-1 medical safety approved
- With power good and fail signal output
- Built-in remote ON-OFF control
- Built-in remote sense function
- Fixed switching frequency at 100KHz
- 3 years warranty

MODEL	OUTPUT VOLTAGE	RATED CURRENT	OUTPUT CURRENT				RIPPLE & NOISE (Max.) (Note 2)	VOLTAGE TOLERANCE (Note 3)	LINE REGULATION	LOAD REGULATION	EFFICIENCY
			MINIMUM LOAD	CONVECTION (max.)	WITH FAN (25CFM)	PEAK LOAD WITH 25CFM FAN (Note 4)					
MPT-200C	5V	20A	4A	15A	20A	24A	80mVp-p	±2.0%	±0.5%	±1.0%	79%
	15V	4.7A	0.5A	3.3A	4.7A	5.6A	150mVp-p	±8.0%	±1.0%	±5.0%	
	-15V	2A	0A	1A	2A	2.4A	80mVp-p	±5.0%	±0.5%	±1.0%

6. Interne Kabel

a) AG501 Cable set (Dikon)

The cable set of Dikon is composed of the following cables:

1. From Power Supply MPT-200C to DSPCon2 board. There are 2 connectors on the Power Supply MPT-200C and one connector on the board.
2. Cable form the Power Entry module DD12.23.21.111 to the Power Supply MPT-200C and to the ground screw
3. Cable from the ground screw to the Power Supply MPT-200C and the Earthing socket
