3.5 General-purpose Timer

3.5.1 General Descriptions

Three general-purpose timers are provided. Two timers are 16 bits long and one timer is 32 bits long. Each runs independently. GPT1 ~ 2 use 32k clock source to count, whereas GPT4 uses 26M clock source. The 26M clock source can be gated when the system enters the sleep mode, and this will cause GPT4 to stop counting, whereas 32k clock source is always toggling. GPT1 and GPT2 can operate in one of the two modes: one-shot mode and auto-repeat mode. GPT4 are free running timer. In the one-shot mode, when the timer counts down and reaches 0, it will be halted. In the auto-repeat mode, when the timer reaches 0, it will simply be reset to counting down the initial value and repeating the count-down to 0. This loop keeps repeating until the disabling signal is set to 1. Regardless of the timer's mode, if the countdown initial value (i.e. GPTIMER1_DAT for GPT1 or GPTIMER_DAT2 for GPT2) is written when the timer is running, the new initial value will not take effect until the next time the timer is restarted. In the auto-repeat mode, the new countdown start value is used on the next countdown iteration. Therefore, before enabling the timer, the desired values for GPTIMER_DAT and the GPTIMER_PRESCALER registers must first be set.

Note that GPTimer's design is inherited from MT6260, GPT3 is removed for achieving lower cost.

For other timers, register addresses are the same with those of MT6260.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CNT[15:0]															
Type	RO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31:0	CNT	CNT	If EN = 1, GPT4 will be a free running timer. This register records the GPT4 value. If EN = 0, this register will be cleared to 0. This register does not allow continuous read. It requires at least 1 26M clock cycle between 2 APB reads.

3.5.3 Application Note

When the GPT is in running status, GPTIMER_DAT cannot be configured. To start GPT1 or GPT2, SW should make sure the timer has finished counting for at least 3 cycles of the 32kHz clock.

3.6 MCU OSTIMER

3.6.1 Overview

Figure 31. OS timer system view

The OS timer is a hardware timer which specifies the OS time frame duration and generates time-out interrupts by programming the frame counter number. The OS timer has the pause mode. The user can specify pause duration period before the pause mode, and the timer will resume from the pause mode by the external wakeup sources or when the pause duration is timed out.

3.6.2 Terminology

Table 46. Abbreviations

Abbreviation	
R/W	Read/Write
RO	Read only
WO	Write only
W1C	Write 1 to clear
RW1C	Read/Write 1 to clear
FRC	Free running counter in the system
OST	OS timer

3.6.3 Introduction to Wakeup Source

The OS timer only accepts level trigger wakeup source. The wakeup sources are all treated as asynchronous input (will be changed) and will be synchronized by OST clock in OST wakeup source controller.

The possible wakeup sources are listed in the table below.

Table 47. Wakeup sources

No	Wakeup source
0	GPT
1	EINT
2	Timer trigger
3	KP
4	MSDC
5	ANALOG
6	DSP
7	MSDC2
8	SPISLV
9	Reserved
10	Reserved
11	DSP_ASYNC
12	Reserved

10	Reserved			
11	DSP_ASYNC	Level		DSP_CK
12	Reserved			
13	Reserved			
14	Reserved			
15	Reserved			
16	Reserved			

Figure 32. Wakeup event and irq_b integration diagram

wakeup_irq_b may be asserted before wakeup_event_b is asserted from the wakeup source peripheral to ensure the software will enter wakeup ISR after the pause command is set.

Recommended software programming sequence:

1. I-BIT is set when a pause command is executed.
2. Set up IRQ mask registers to select IRQ wakeup sources
3. Pause criteria are met.
4. Set up pause command.
5. Confirm the pause command is executed at OST, and check if the pause command is pending or not.
6. Set up processor in request for interrupt state.
7. The processor clock will be off if there is no interrupt.
8. Check if the pause request command is completed (after the processor clock is active or resumes).
9. Clear I-BIT.

3.6.4 Register Definition

Address	Name	Width	Register function
0XA01F0000	<u>OST_CON</u>	32	OS timer control register Only updated when OST_CMD.OST_WR is set and OST_STA.WR_RDY is high.
0XA01F0004	<u>OST_CMD</u>	32	OS timer command Only valid when the write data BIT31 to BIT16 is 0x1153.
0XA01F0008	<u>OST_STA</u>	32	OS timer status
0XA01F000C	<u>OST_FRM</u>	32	OS timer frame duration Specifies OS timer frame duration by micron second resolution. The maximum duration is 8ms and minimum duration is 1ms. This register should be set before OS timer is enabled. The hardware will set up OST_ISR[0] periodically at frame duration period when the OS timer is enabled.
0XA01F0010	<u>OST_FRM_F32K</u>	32	OS timer frame duration by 32K clock

Address	Name	Width	Register function
			Specifies OS timer frame duration with 30.5176 micron second (32kHz) resolution. The maximum duration is 8ms and minimum duration is 1ms. This register should be set before the OS timer is enabled. OST_FRAM_F32K*30.5176us should be less than OST_FRM_NUM*OST_FRM*1us - 30.5176us. Set up OST_FRM_NUM if the frame duration is shorter than system settling time.
0XA01F0014	<u>OST_UFN</u>	32	OS timer un-alignment frame number Specifies OS timer un-alignment event frame number count. This register value is updated to OS timer only when OST_CMD.OST_WR is set. The read value of this register may not be the current OS time Un-alignment frame number. The hardware will count down the OST_UFN counter at frame time-out and stop the count-down when the current value is 0. When the OS timer is in the pause mode, this counter is still active and wakes up the OS timer when OST_UFN becomes 0 at frame time-out boundary. The software should enable the OS timer pause mode when OST_UFN is larger than 1, or the pause command will be ignored by the hardware.
0XA01F0018	<u>OST_AFN</u>	32	OS timer alignment frame number Specifies OS timer alignment event frame number count. This register value is updated to the OS timer only when OST_CMD.OST_WR is set. The read value of this register may not be the current OS time alignment frame number. The hardware will count down the OST_AFN counter at frame time-out and stop the count-down when the current value is 0. The hardware will set OST_ISR[1] when OST_AFN is 1 or 0 at frame time-out, and the OS timer is in normal mode. OST_AFN is current hardware AFN down counter value, and the software cannot read this register directly. The software can only read the current frame number through the OST_AFN_R register, and there is synchronization latency from OST_AFN to OST_AFN_R.
0XA01F001C	<u>OST_AFN_DLY</u>	32	OS timer alignment frame delay number count Specifies the OS timer alignment event frame delay count due to OS timer pause mode. The software has to use the OST_CMD.OST_RD command to update this register value, or the value may be out of date.
0XA01F0020	<u>OST_UFN_R</u>	32	Current OS timer un-alignment frame number Specifies the OS timer current un-alignment frame number. The software has to use the OST_CMD.OST_RD command to update this register value, or the value may be out of date.
0XA01F0024	<u>OST_AFN_R</u>	32	Current OS timer alignment frame number Specifies the OS timer current alignment frame number. The software has to use the OST_CMD.OST_RD command to update this register value, or the value may be out of date.
0XA01F0030	<u>OST_INT_MASK</u>	32	OS timer interrupt mask Specifies the OS timer interrupt mask control.
0XA01F0040	<u>OST_ISR</u>	32	OS timer interrupt status Specifies the OS timer interrupt status. The software has to write 1 at the corresponding bit to clear the interrupt status bit. OSR_ISR[2-0] are also cleared when the OSR_WR command is executed and AFN, UFN are updated.

Address	Name	Width	Register function
0XA01F0050	<u>OST_EVENT_MASK_K</u>	32	OS timer event mask Specifies which wakeup event will be masked to wake up the OS timer in the OS timer pause mode.
0XA01F0054	<u>OST_WAKEUP_STA</u>	32	OS timer event wakeup status
0XA01F0060	<u>OST_DBG_WAKEUP</u>	32	OS timer debug wakeup

0XA01F0000

OS Timer Control Register

OST_CON

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type

3.7 UART1

3.7.1 General Description

The baseband chipset houses two UARTs. The UARTs provide full duplex serial communication channels between baseband chipset and external devices.

The UART has M16C450 and M16550A modes of operation, which are compatible with a range of standard software drivers. The extensions have been designed to be broadly software compatible with 16550A variants, but certain areas offer no consensus.

In common with the M16550A, the UART supports word lengths **from 5 to 8 bits, an optional parity bit** and one or two stop bits, and is fully programmable by an 8-bit CPU interface. A 16-bit programmable baud rate generator and an 8-bit scratch register are included, together with separate transmit and receive FIFOs. 8 modem control lines and a diagnostic loop-back mode are provided. UART also includes two DMA handshake lines, indicating when the FIFOs are ready to transfer data to the CPU. Interrupts can be generated from any of the 10 sources.

Note that UART is designed so that all internal operation is synchronized by the CLK signal. This synchronization results in minor timing differences between the UART and industry standard 16550A device, which means that the core is not clock for clock identical to the original device.

After a hardware reset, UART will be in M16C450 mode. Its FIFOs can then be enabled and UART can enter M16550A mode. UART has further functions beyond the M16550A mode. Each of the

extended functions can be selected individually under software control.

UART provides more powerful enhancements than the industry-standard 16550:

- Hardware flow control. This feature is very useful when the ISR latency is hard to predict and control in the embedded applications. The MCU is relieved of having to fetch the received data within a fixed amount of time.

Note that in order to enable any of the enhancements, the Enhanced Mode bit, EFR[4], must be set. If EFR[4] is not set, IER[7:5], FCR[5:4], IIR[5:4] and MCR[7:6] cannot be written. The enhanced mode bit ensures that UART is backward compatible with the software that has been written for 16C450 and 16550A devices. **Figure 35** is the block diagram of the UART1 device.

Figure 35. Block Diagram of UART1

3.7.2 Register Definition

Module name: UART1 Base address: (+A0080000h)

Address	Name	Width	Register Function
A0080000	<u>RBR</u>	8	RX Buffer Register Note: Only when LCR[7] = 0.
A0080000	<u>THR</u>	8	TX Holding Register Note: Only when LCR[7] = 0
A0080000	<u>DLL</u>	8	Divisor Latch (LS) Divides the bclk frequency Note: Modified when LCR[7] != 0
A0080004	<u>IER</u>	8	Interrupt Enable Register Note: Only when LCR[7] = 0. By storing 1 to a specific bit position, the interrupt associated with that bit is enabled. Otherwise, the interrupt will be disabled.

Address	Name	Width	Register Function
			IER[3:0] are modified when LCR[7] = 0. IER[7:4] are modified when LCR[7] = 0 & EFR[4] = 1.
A0080004	<u>DLM</u>	8	Divisor Latch (MS) Used to divide the clock frequency. *NOTE: modified when LCR[7] != 0
A0080008	<u>IIR</u>	8	Interrupt Identification Register Note: Only when LCR != BF'h. Priority is from high to low as the following. IIR[5:0] = 0X1: No interrupt pending IIR[5:0] = 0X6: Line status interrupt (under IER[2] = 1) IIR[5:0] = 0Xc: RX data time-out interrupt (under IER[0] = 1) IIR[5:0] = 0X4: RX data are placed in the RX bBuffer register or the RX trigger level is reached. (under IER[0] = 1). IIR[5:0] = 0X2: TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level (under IER[1] = 1). IIR[5:0] = 0X10: XOFF character received (under IER[5] = 1, EFR[4] = 1).
A0080008	<u>FCR</u>	8	FIFO Control Register FCR is used to control the trigger levels of the FIFOs or flush the FIFOs. FCR[7:6] is modified when LCR != BF'h FCR[5:4] is modified when LCR != BF'h & EFR[4] = 1 FCR[4:0] is modified when LCR != BF'h
A0080008	<u>EFR</u>	8	Enhanced Feature Register Note: Only when LCR = BF'h
A008000C	<u>LCR</u>	8	Line Control Register Determines characteristics of serial communication signals.
A0080010	<u>MCR</u>	8	Modem Control Register Controls interface signals of the UART. MCR[5:0] are modified when LCR != 8'hBF, MCR[7] can be read when LCR != 8'hBF & EFR[4] = 1.
A0080010	<u>XON1</u>	8	XON1 Char Register Note: XON1 is modified only when LCR = BF'h.
A0080014	<u>LSR</u>	8	Line Status Register Modified when LCR != BF'h.
A0080018	<u>XOFF1</u>	8	XOFF1 Char Register *Note: XOFF1 is modified only when LCR = BF'h.
A008001C	<u>SCR</u>	8	Scratch Register A general purpose read/write register. After reset, its value will be un-defined. Modified when LCR != BF'h.
A0080020	<u>AUTOBAUD EN</u>	8	Auto Baud Detect Enable Register
A0080024	<u>HIGHSPEED</u>	8	High Speed Mode Register
A0080028	<u>SAMPLE COUNT</u>	8	Sample Counter Register When HIGHSPEED = 3, sample_count will be the threshold value for UART sample counter (sample_num). Count from 0 to sample_count.
A008002C	<u>SAMPLE POINT</u>	8	Sample Point Register When HIGHSPEED = 3, UART gets the input data when sample_count = sample_num, e.g. system clock = 13MHz,

Address	Name	Width	Register Function
			921600 = 13000000/14. Therefore, sample_count = 13, and sample point = 6 (sampling the central point to decrease the inaccuracy) SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 without decimal.
A0080030	<u>AUTOBAUD REG</u>	8	Auto Baud Monitor Register the autobaud detection state ,it will not change until enable the autobaud_en again.
A0080034	<u>RATEFIX AD</u>	8	Clock Rate Fix Register
A0080038	<u>AUTOBAUDSAMPL E</u>	8	Auto Baud Sample Register Since the system clock may change, autobaud sample duration should change as the system clock changes. When system clock = 13MHz, autobaudsample = 6; when system clock = 26MHz, autobaudsample = 13. When system clock = 52MHz, autobaudsample = 27.
A008003C	<u>GUARD</u>	8	Guard Time Added Register
A0080040	<u>ESCAPE DAT</u>	8	Escape Character Register
A0080044	<u>ESCAPE EN</u>	8	Escape Enable Register
A0080048	<u>SLEEP EN</u>	8	Sleep Enable Register
A008004C	<u>DMA EN</u>	8	DMA Enable Register
A0080050	<u>RXTRI AD</u>	8	Rx Trigger Address
A0080054	<u>FRACDIV L</u>	8	Fractional Divider LSB Address
A0080058	<u>FRACDIV M</u>	8	Fractional Divider MSB Address
A008005C	<u>FCR RD</u>	8	FIFO Control Register

A0080000 RBR RX Buffer Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RBR							
Type									RU							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	RBR	Read-only register The received data can be read by accessing this register. Only when LCR[7] = 0.

A0080000 THR TX Holding Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									THR							
Type									WO							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	THR	TX Holding Register Write-only register. The data to be transmitted are written to this register and sent to the PC via serial communication.

Bit(s)	Name	Description
		Only when LCR[7] = 0.

A0080000 DLL Divisor Latch (LS) 01

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLL							
Type									RW							
Reset									0	0	0	0	0	0	0	1

Bit(s)	Name	Description
7:0	DLL	Divisor latch low 8-bit data Note: Modified when LCR[7] != 0.

A0080004 IER Interrupt Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									CTSI	RTSI	XOFFI		EDSSI	ELSI	ETBEI	ERBFI
Type									RW	RW	RW		RW	RW	RW	RW
Reset									0	0	0		0	0	0	0

Bit(s)	Name	Description
7	CTSI	Masks an interrupt that is generated when a rising edge is detected on the CTS modem control line. Note: This interrupt is only enabled when hardware flow control is enabled. 0: Mask an interrupt that is generated when a rising edge is detected on the CTS modem control line. 1: Unmask an interrupt that is generated when a rising edge is detected on the CTS modem control line.
6	RTSI	Masks an interrupt that is generated when a rising edge is detected on the RTS modem control line. Note: This interrupt is only enabled when hardware flow control is enabled. 0: Mask an interrupt that is generated when a rising edge is detected on the RTS modem control line. 1: Unmask an interrupt that is generated when a rising edge is detected on the RTS modem control line.
5	XOFFI	Masks an interrupt that is generated when an XOFF character is received. Note: This interrupt is only enabled when software flow control is enabled. 0: Mask an interrupt that is generated when an XOFF character is received. 1: Unmask an interrupt that is generated when an XOFF character is received.
3	EDSSI	When set to 1, an interrupt will be generated if DCTS (MSR[0]) becomes set. 0: No interrupt is generated if DCTS (MSR[0]) becomes set. 1: An interrupt is generated if DCTS (MSR[0]) becomes set.
2	ELSI	When set to 1, an interrupt will be generated if BI, FE, PE or OE (LSR[4:1]) becomes set. 0: No interrupt is generated if BI, FE, PE or OE (LSR[4:1]) becomes set. 1: An interrupt is generated if BI, FE, PE or OE (LSR[4:1]) becomes set.
1	ETBEI	When set to 1, an interrupt will be generated if the TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level. 0: No interrupt will be generated if the TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level. 1: An interrupt will be generated if the TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level.
0	ERBFI	When set to 1, an interrupt will be generated if RX data are placed in RX buffer register or the RX trigger level is reached.

Bit(s)	Name	Description
		0: No interrupt will be generated if RX data are placed in the RX buffer register or the RX trigger level is reached.
		1: An interrupt will be generated if RX Data are placed in the RX buffer register or the RX trigger level is reached.

A0080004 DLM Divisor Latch (MS) 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
		Divisor latch high 8-bit data
		<i>Note: Modified when LCR[7]=0. DLL & DLM can only be updated when DLAB(LCR[7]) is set to 1. Division by 1 will generate a BAUD signal that is constantly high. DLL & DLM setting formula is {DLH,DLL}=(system clock frequency/baud_pulse/baud_rate). When RATE_FIX(RATEFIX_AD[0])=0, system clock frequency = 52MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=0, system clock frequency = 26MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=1, system clock frequency = 13MHz. For baud_pulse value, refer to HIGH_SPEED(offset=24H) register. For example, when at 52MHz, default speed mode and 115200 baud rate, {DLH,DLL}=52MHz/16/115200=28.</i>
7:0	DLM	

A0080008 IIR Interrupt Identification Register 01

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	1

Bit(s)	Name	Description
7:6	FIFOE	
5:0	ID	IIR[5:0] Priority level interrupt source 000001 - No interrupt pending 000110 1 Line status interrupt: BI, FE, PE or OE set in LSR. (Under IER[2]=1) 001100 2 RX data time-out: Time-out on character in RX FIFO. (Under IER[0]=1) 000100 3 RX data received: RX data received or RX trigger level reached. (Under IER[0]=1) 000010 4 TX holding register empty: 000000 5 Modem status change: DCTS set in MSR. (Under IER[3]=1) TX Holding Register empty or TX FIFO trigger level reached. (Under IER[1]=1) 010000 6 Software flow control: XOFF Character received. (Under IER[5]=1) 100000 7 Hardware flow control: CTS or RTS Rising Edge. (Under IER[7]=1 or IER[6]=1)
		Line status interrupt: A RX line status interrupt (IIR[5:0] = 000110b) will be generated if ELSI (IER[2]) is set and any of BI, FE, PE or OE (LSR[4:1]) becomes set. The interrupt is cleared by reading the line status register.
		RX data time-out interrupt: When the virtual FIFO mode is disabled, RX data time-out

Bit(s)	Name	Description
		interrupt will be generated if all of the following conditions are applied: 1. FIFO contains at least one character. 2. The most recent character is received longer than four character periods ago (including all start, parity and stop bits); 3. The most recent CPU read of the FIFO is longer than four character periods ago. The timeout timer is restarted upon receipt of a new byte from the RX shift register or upon a CPU read from the RX FIFO. The RX data time-out interrupt is enabled by setting EFRBI (IER[0]) to 1 and is cleared by reading RX FIFO. When the virtual FIFO mode is enabled, RX data time-out interrupt will be generated if all of the following conditions are applied: 1. The FIFO is empty. 2. The most recent character is received longer than four character periods ago (including all start, parity and stop bits). 3. The most recent CPU read of the FIFO is longer than four character periods ago. The timeout timer is restarted upon receipt of a new byte from the RX shift register or reading DMA_EN register. The RX Data Timeout Interrupt is enabled by setting EFRBI (IER[0]) to 1 and is cleared by reading DMA_EN register. RX data received interrupt: A RX received interrupt (IER[5:0] = 000100b) is generated if EFRBI (IER[0]) is set and either RX data are placed in the RX buffer register or the RX trigger level is reached. The interrupt is cleared by reading the RX buffer register or the RX FIFO (if enabled). TX holding register empty interrupt: A TX holding register empty interrupt (IIR[5:0] = 000010b) is generated if ETRBI (IER[1]) is set and either the TX holding register is empty or the contents of the TX FIFO are reduced to its trigger level. The interrupt is cleared by writing to the TX holding register or TX FIFO if FIFO is enabled. Modem status change interrupt: A modem status change Interrupt (IIR[5:0] = 000000b) will be generated if EDSSI (IER[3]) is set and e DCTS (MSR[3:0]) becomes set. The interrupt is cleared by reading the modem status register. Software flow control interrupt: A software flow control interrupt (IIR[5:0] = 010000b) will be generated if the software flow control is enabled and XOFFI (IER[5]) becomes set, indicating that an XOFF character has been received. The interrupt is cleared by reading the interrupt identification register. Hardware flow control interrupt: A hardware flow control interrupt (IER[5:0] = 100000b) will be generated if the hardware flow control is enabled and either RTSI (IER[6]) or CTSI (IER[7]) becomes set indicating that a rising edge has been detected on either the RTS/CTS modem control line. The interrupt is cleared by reading the interrupt identification register.

A0080008	FCR	FIFO Control Register												00		
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1_RFTL0		TFTL1_TFTL0			CLRT	CLRR	FIFOE
Type									WO		WO			WO	WO	WO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description
7:6	RFTL1_RFTL0	RX FIFO trigger threshold RX FIFO contains total 32 bytes. 0: 1 1: 6 2: 12

Bit(s)	Name	Description	
3: RXTRIG			
5:4	TFTL1_TFTL0	TX FIFO trigger threshold TX FIFO contains total 32 bytes. 0: 1 1: 4 2: 8 3: 14	
2	CLRT	Control bit to clear TX FIFO 0: No effect 1: Clear TX FIFO	
1	CLRR	Control bit to clear RX FIFO 0: No effect 1: Clear RX FIFO	
0	FIFOE	Enables FIFO This bit must be set to 1 for any of other bits in the registers to have any effect. 0: Disable both RX and TX FIFOs. 1: Enable both RX and TX FIFOs.	

A0080008 EFR Enhanced Feature Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									AUTO_CTS	AUTO_RTS		ENABL_E_E	SW_FLOW_CONT			
Type									RW	RW		RW	RW			
Reset									0	0		0	0	0	0	0

Bit(s)	Name	Description	
7	AUTO_CTS	Enables hardware transmission flow control 0: Disable 1: Enable	
6	AUTO_RTS	Enables hardware reception flow control 0: Disable 1: Enable	
4	ENABLE_E	Enables enhancement feature 0: Disable 1: Enable	
3:0	SW_FLOW_CONT	Software flow control bits 00xx: No TX flow control 01xx: No TX flow control 10xx: Transmit XON1/XOFF1 as flow control bytes xx00: No RX flow control xx01: No RX flow control xx10: Receive XON1/XOFF1 as flow control bytes	

A008000C LCR Line Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLAB	SB	SP	EPS	PEN	STB	WLS1	WLS0
Type									RW	RW	RW	RW	RW	RW	RW	RW
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	DLAB	Divisor latch access bit

Bit(s)	Name	Description
		0: RX and TX registers are read/written at Address 0 and the IER register is read/written at Address 4. 1: Divisor Latch LS is read/written at Address 0 and the Divisor Latch MS is read/written at Address 4.
6	SB	Set break 0: No effect 1: SOUT signal is forced to the 0 state.
5	SP	Stick parity 0: No effect. 1: The parity bit is forced to a defined state, depending on the states of EPS and PEN: If EPS=1 & PEN=1, the parity bit will be set and checked = 0. If EPS=0 & PEN=1, the parity bit will be set and checked = 1.
4	EPS	Selects even parity 0: When EPS=0, an odd number of ones is sent and checked. 1: When EPS=1, an even number of ones is sent and checked.
3	PEN	Enables parity 0: The parity is neither transmitted nor checked. 1: The parity is transmitted and checked.
2	STB	Number of STOP bits 0: One STOP bit is always added. 1: Two STOP bits are added after each character is sent; unless the character length is 5 when 1 STOP bit is added.
1:0	WLS1_WLS0	Selects word length 0: 5 bits 1: 6 bits 2: 7 bits 3: 8 bits

A0080010 MCR Modem Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XOFF STATUS			Loop			RTS	
Type									RU			RW			RW	
Reset									0			0			0	

Bit(s)	Name	Description
7	XOFF_STATUS	Read-only bit 0: When an XON character is received. 1: When an XOFF character is received.
4	Loop	Loop-back control bit 0: No loop-back is enabled. 1: Loop-back mode is enabled.
1	RTS	Controls the state of the output NRTS, even in loop mode. 0: RTS will always output 1. 1: RTS's output will be controlled by flow control condition.

A0080010 XON1 XON1 Char Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XON1							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	XON1	XON1 character for software flow control Modified only when LCR=BFh.

A0080014 **LSR** Line Status Register 60

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FIFOE RR	TEMT	THRE	BI	FE	PE	OE	DR
Type									RU	RU	RU	RU	RU	RU	RU	RU
Reset									0	1	1	0	0	0	0	0

Bit(s)	Name	Description
7	FIFOERR	RX FIFO error indicator 0: No PE, FE, BI set in the RX FIFO. 1: Set to 1 when there is at least one PE, FE or BI in the RX FIFO.
6	TEMT	TX holding register (or TX FIFO) and the TX shift register are empty. 0: Empty conditions below are not met. 1: If FIFOs are enabled, the bit will be set whenever the TX FIFO and the TX shift register are empty. If FIFOs are disabled, the bit will be set whenever TX holding register and TX shift register are empty.
5	THRE	Indicates if there is room for TX holding register or TX FIFO is reduced to its trigger level 0: Reset whenever the contents of the TX FIFO are more than its trigger level (FIFOs are enabled), or whenever TX holding register is not empty (FIFOs are disabled). 1: Set whenever the contents of the TX FIFO are reduced to its trigger level (FIFOs are enabled), or whenever TX holding register is empty and ready to accept new data (FIFOs are disabled).
4	BI	Break interrupt 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit will be set whenever the SIN is held in the 0 state for more than one transmission time (START bit + DATA bits + PARITY + STOP bits). If the FIFOs are enabled, this error will be associated with a corresponding character in the FIFO and is flagged when this byte is at the top of the FIFO. When a break occurs, only one zero character is loaded into the FIFO. The next character transfer is enabled when SIN goes into the marking state and receives the next valid start bit.
3	FE	Framing error 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit will be set if the received data do not have a valid STOP bit. If the FIFOs are enabled, the state of this bit will be revealed when the byte it refers to is the next to be read.
2	PE	Parity error 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit will be set if the received data do not have a valid parity bit. If the FIFOs are enabled, the state of this bit will be revealed when the referred byte is the next to be read.
1	OE	Overrun error 0: Reset by the CPU reading this register. 1: If the FIFOs are disabled, this bit will be set if the RX buffer is not read by the CPU before the new data from the RX shift register overwrites the previous contents. If the FIFOs are enabled, an overrun error will occur when the RX FIFO is full and the RX shift register becomes full. OE will be set as soon as this happens. The character in the shift register is then overwritten, but not transferred to the FIFO.
0	DR	Data ready 0: Cleared by the CPU reading the RX buffer or by reading all the FIFO bytes. 1: Set by the RX buffer becoming full or by the FIFO becoming empty.

A0080018 **XOFF1** **XOFF1 Char Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XOFF1							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	XOFF1	XOFF1 character for software flow control Modified only when LCR=BFh.

A008001C **SCR** **Scratch Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SCR							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SCR	General purpose read/write register After reset, its value will be undefined. Modified when LCR != BFh.

A0080020 **AUTOBAUD_EN** **Auto Baud Detect Enable Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														SLEEP_ACK_SEL	AUTOBAUD_SEL	AUTOBAUD_EN
Type														RW	RW	RW
Reset														0	0	0

Bit(s)	Name	Description
2	SLEEP_ACK_SEL	Selects sleep ack when autobaud_en 0: Support sleep_ack when autobaud_en is opened. 1: Does not support sleep_ack when autobaud_en is opened.
1	AUTOBAUD_SEL	Selects auto-baud 0: Support standard baud rate detection. 1: Support non_standard baud rate detection (support baud from 110 to 115200; recommended to use 52MHz to auto fix).
0	AUTOBAUD_EN	Auto-baud enabling signal 0: Disable auto-baud function. 1: Enable auto-baud function (UARTn+0024h SPEED should be set to 0.) <i>Note: When AUTOBAUD_EN is active, there should not be A*/a* char before the auto baud char AT/at. If A*/a* is inevitable, autobaud will fail and please disable AUTOBAUD_EN to reset the autobaud feature and autobaud_en again.</i>

A0080024 **HIGHSPEED** **High Speed Mode Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															SPEED	
Type															RW	

Reset																0	0
-------	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	---	---

Bit(s)	Name	Description
1:0	SPEED	UART sample counter base 0: Based on 16*baud_pulse, baud_rate = system clock frequency/16/{DLH, DLL} 1: Based on 8*baud_pulse, baud_rate = system clock frequency/8/{DLH, DLL} 2: Based on 4*baud_pulse, baud_rate = system clock frequency/4/{DLH, DLL} 3: Based on sampe_count * baud_pulse, baud_rate = system clock frequency / (sampe_count+1){DLM, DLL}

A0080028 **SAMPLE COUN**
I **Sample Counter Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SAMPLECOUNT	Only useful when HIGHSPEED mode = 3.

A008002C **SAMPLE POINT**
I **Sample Point Register** **FF**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	SAMPLEPOINT	SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 without decimal. Effective only when HIGHSPEED=3.

A0080030 **AUTOBAUD_RE**
G **Auto Baud Monitor Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:4	BAUD_STAT	Autobaud state (only true value in standard autobaud detection) 0: Autobaud is detecting. 1: AT_7N1 2: AT_7O1 3: AT_7E1 4: AT_8N1 5: AT_8O1 6: AT_8E1 7: at_7N1 8: at_7E1 9: at_7O1 10: at_8N1

Bit(s)	Name	Description
		11: at_8E1
		12: at_801
		13: Autobaud detection fails
3:0	BAUD_RATE	Autobaud baud rate (only true value in standard autobaud detection)
		0: 115,200
		1: 57,600
		2: 38,400
		3: 19,200
		4: 9,600
		5: 4,800
		6: 2,400
		7: 1,200
		8: 300
		9: 110

A0080034 RATEFIX_AD Clock Rate Fix Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														FREQ_SEL	AUTOBAUD_RATE_FIX	
Type														RW	RW	RW
Reset														0	0	0

Bit(s)	Name	Description
2	FREQ_SEL	0: Select 26MHz as system clock 1: Select 13MHz as system clock
1	AUTOBAUD_RATE_FIX	0: Use 52MHz as system clock for UART auto baud detection 1: Use 26MHz/13MHz (depending on FREQ_SEL) as system clock for UART auto baud detection
0	RATE_FIX	0: Use 52MHz as system clock for UART TX/RX 1: Use 26MHz/13MHz (depending on FREQ_SEL) as system clock for UART TX/RX

A0080038 AUTOBAUDSAMPLE Auto Baud Sample Register 0D

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset											0	0	1	1	0	1

Bit(s)	Name	Description
		clk division for autobaud rate detection
		For standard baud rate detection.
		System clk 52m: 'd 27
		System clk 26m: 'd 13
		System dk 13m: 'd 6
5:0	AUTOBAUDSAMPLE	For non-standard baud rate detection.
		:15.

A008003C GUARD Guard Time Added Register 0F

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												GUAR D_EN	GUARD_CNT			
Type												RW	RW			
Reset												0	1	1	1	1

Bit(s)	Name	Description
4	GUARD_EN	Guard interval add enabling signal 0: No guard interval added 1: Add guard interval after stop bit
3:0	GUARD_CNT	Guard interval count value Guard interval = $[1/(\text{system dock/div_step/div})] * \text{GUARD_CNT}$.

A0080040 ESCAPE_DAT Escape Character Register FF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												ESCAPE_DAT				
Type												RW				
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	ESCAPE_DAT	Escape character added before software flow control data and escape character If TX data are xon (31h), with esc_en=1, UART will transmit data as esc + CEh (~xon).

A0080044 ESCAPE_EN Escape Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																ESC_E N
Type																RW
Reset																0

Bit(s)	Name	Description
0	ESC_EN	Adds escape character in transmitter and removes escape character in receiver by UART 0: Does not deal with the escape character 1: Add escape character in transmitter and remove escape character in receiver

A0080048 SLEEP_EN Sleep Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SLEEP _EN
Type																RW
Reset																0

Bit(s)	Name	Description
0	SLEEP_EN	For sleep mode issue 0: Does not deal with sleep mode indicate signal 1: Activate hardware flow control or software control according to software initial setting when the chip enters sleep mode. Release hardware flow when the chip wakes up. However, for software control, UART sends xon when awoken and when FIFO does not

Bit(s)	Name	Description
		reach threshold level.

A008004C DMA_EN DMA Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													FIFO_Lsr_sel	TO_CNT_AUTORST	TX_DMA_EN	RX_DMA_EN
Type													RW	RW	RW	RW
Reset													0	0	0	0

Bit(s)	Name	Description
3	FIFO_Lsr_sel	Selects FIFO LSR mode 0: LSR will hold the first line status error state until you read the LSR register. 1: LSR will update automatically.
2	TO_CNT_AUTORST	Time-out counter auto reset register 0: After RX time-out happens, SW shall reset the interrupt by reading UART 0x4C. 1: The time-out counter will be auto reset. Set this register when Rain's new DMA is used.
1	TX_DMA_EN	TX_DMA mechanism enabling signal 0: Does not use DMA in TX 1: Use DMA in TX. When this register is enabled, the flow control will be based on the DMA threshold and generate a time-out interrupt for DMA.
0	RX_DMA_EN	RX_DMA mechanism enabling signal 0: Does not use DMA in RX 1: Use DMA in RX. When this register is enabled, the flow control will be based on the DMA threshold and generate a time-out interrupt

A0080050 RXTRIG_AD Rx Trigger Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													RXTRIG			
Type													RW			
Reset													0	0	0	0

Bit(s)	Name	Description
3:0	RXTRIG	When {rtm,rti}=2'b11, the RX FIFO threshold will be Rxtrig. The value is suggested to be smaller than half of RX FIFO size, which is 32 bytes.

A0080054 FRACDIV_L Fractional Divider LSB Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FRACDIV_L							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	FRACDIV_L	Adds sampling count (+1) from state data7 to data0 to contribute fractional divisor. only when high_speed=3.

A0080058 **FRACDIV_M** **Fractional Divider MSB Address** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FRACDIV_M
Type																RW
Reset															0	0

Bit(s)	Name	Description
1:0	FRACDIV_M	Adds sampling count when in state stop to parity to contribute fractional divisor only when high_speed=3.

A008005C **FCR_RD** **FIFO Control Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1	RFTL0	TFTL1	TFTL0		CLRT	CLRR	FIFOE
Type									RO		RO			RO	RO	RO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description
7:6	RFTL1_RFTL0	RX FIFO trigger threshold RX FIFO contains total 32 bytes. 0: 1 1: 6 2: 12 3: RXTRIG
5:4	TFTL1_TFTL0	TX FIFO trigger threshold TX FIFO contains total 32 bytes. 0: 1 1: 4 2: 8 3: 14
2	CLRT	0: TX FIFO is not cleared. 1: TX FIFO is cleared.
1	CLRR	0: RX FIFO is not cleared. 1: RX FIFO is cleared.
0	FIFOE	Enables FIFO This bit must be set to 1 for any of other bits in the registers to have any effect. 0: RX and TX FIFOs are not enabled. 1: RX and TX FIFOs are enabled.

3.8 UART2

3.8.1 General Description

The baseband chipset houses two UARTs. The UARTs provide full duplex serial communication channels between baseband chipset and external devices.

The UART has M16C450 and M16550A modes of operation, which are compatible with a range of standard software drivers. The extensions have been designed to be broadly software compatible with 16550A variants, but certain areas offer no consensus.

In common with the M16550A, the UART supports word lengths **from 5 to 8 bits, an optional parity bit** and one or two stop bits, and is fully programmable by an 8-bit CPU interface. A 16-bit programmable baud rate generator and an 8-bit scratch register are included, together with separate transmit and receive FIFOs. 8 modem control lines and a diagnostic loop-back mode are provided. UART also includes two DMA handshake lines, indicating when the FIFOs are ready to transfer data to the CPU. Interrupts can be generated from any of the 10 sources.

Note that UART is designed so that all internal operation is synchronized by the CLK signal. This synchronization results in minor timing differences between the UART and industry standard 16550A device, which means that the core is not clock for clock identical to the original device.

After a hardware reset, UART will be in M16C450 mode. Its FIFOs can then be enabled and UART can enter M16550A mode. UART has further functions beyond the M16550A mode. Each of the extended functions can be selected individually under software control.

UART provides more powerful enhancements than the industry-standard 16550:

- **Hardware flow control.** This feature is very useful when the ISR latency is hard to predict and control in the embedded applications. The MCU is relieved of having to fetch the received data within a fixed amount of time.

Note that in order to enable any of the enhancements, the Enhanced Mode bit, EFR[4], must be set. If EFR[4] is not set, IER[7:5], FCR[5:4], IIR[5:4] and MCR[7:6] cannot be written. The enhanced mode bit ensures that UART is backward compatible with the software that has been written for 16C450 and 16550A devices. **Figure 35** is the block diagram of the UART2 device.

Figure 36. Block Diagram of UART2

3.8.2 Register Definition

Module name: UART2 Base address: (+A0090000h)

Address	Name	Width	Register Function
A0090000	<u>RBR</u>	8	RX Buffer Register Note: Only when LCR[7] = 0.
A0090000	<u>THR</u>	8	TX Holding Register Note: Only when LCR[7] = 0
A0090000	<u>DLL</u>	8	Divisor Latch (LS) Divides the bclk frequency Note: Modified when LCR[7] != 0
A0090004	<u>IER</u>	8	Interrupt Enable Register Note: Only when LCR[7] = 0. By storing 1 to a specific bit position, the interrupt associated with that bit is enabled. Otherwise, the interrupt will be disabled. IER[3:0] are modified when LCR[7] = 0. IER[7:4] are modified when LCR[7] = 0 & EFR[4] = 1.
A0090004	<u>DLM</u>	8	Divisor Latch (MS) Used to divide the bclk frequency. *NOTE: modified when LCR[7] != 0
A0090008	<u>IIR</u>	8	Interrupt Identification Register Note: Only when LCR != BF'h. Priority is from high to low as the following. IIR[5:0] = 0X1: No interrupt pending IIR[5:0] = 0X6: Line status interrupt (under IER[2] = 1) IIR[5:0] = 0Xc: RX data time-out interrupt (under IER[0] = 1) IIR[5:0] = 0X4: RX data are placed in the RX bBuffer register or the RX trigger level is reached. (under IER[0] = 1). IIR[5:0] = 0X2: TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level (under IER[1] = 1). IIR[5:0] = 0X10: XOFF character received (under IER[5] = 1, EFR[4] = 1).
A0090008	<u>FCR</u>	8	FIFO Control Register FCR is used to control the trigger levels of the FIFOs or flush the FIFOs. FCR[7:6] is modified when LCR != BF'h FCR[5:4] is modified when LCR != BF'h & EFR[4] = 1 FCR[4:0] is modified when LCR != BF'h
A0090008	<u>EFR</u>	8	Enhanced Feature Register Note: Only when LCR = BF'h
A009000C	<u>LCR</u>	8	Line Control Register Determines characteristics of serial communication signals.
A0090010	<u>MCR</u>	8	Modem Control Register Controls interface signals of the UART. MCR[5:0] are modified when LCR != 8'hBF, MCR[7] can be read when LCR != 8'hBF & EFR[4] = 1.
A0090010	<u>XON1</u>	8	XON1 Char Register Note: XON1 is modified only when LCR = BF'h.
A0090014	<u>LSR</u>	8	Line Status Register Modified when LCR != BF'h.

Address	Name	Width	Register Function
A0090018	<u>XOFF1</u>	8	XOFF1 Char Register *Note: XOFF1 is modified only when LCR=BFh.
A009001C	<u>SCR</u>	8	Scratch Register A general purpose read/write register. After reset, its value will be un-defined. Modified when LCR != BFh.
A0090020	<u>AUTOBAUD EN</u>	8	Auto Baud Detect Enable Register
A0090024	<u>HIGHSPEED</u>	8	High Speed Mode Register
A0090028	<u>SAMPLE COUNT</u>	8	Sample Counter Register When HIGHSPEED=3, sample_count will be the threshold value for UART sample_counter (sample_num). Count from 0 to sample_count.
A009002C	<u>SAMPLE POINT</u>	8	Sample Point Register When HIGHSPEED=3, UART gets the input data when sample_count=sample_num, e.g. system clock = 13MHz, 921600 = 13000000/14. Therefore, sample_count = 13, and sample point = 6 (sampling the central point to decrease the inaccuracy) SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 without decimal.
A0090030	<u>AUTOBAUD REG</u>	8	Auto Baud Monitor Register the autobaud detection state, it will not change until enable the autobaud_en again.
A0090034	<u>RATEFIX_AD</u>	8	Clock Rate Fix Register
A0090038	<u>AUTOBAUDSAMPL E</u>	8	Auto Baud Sample Register Since the system clock may change, autobaud sample duration should change as the system clock changes. When system clock = 13MHz, autobaudsample = 6; when system clock = 26MHz, autobaudsample = 13. When system clock = 52MHz, autobaudsample = 27.
A009003C	<u>GUARD</u>	8	Guard Time Added Register
A0090040	<u>ESCAPE DAT</u>	8	Escape Character Register
A0090044	<u>ESCAPE EN</u>	8	Escape Enable Register
A0090048	<u>SLEEP EN</u>	8	Sleep Enable Register
A009004C	<u>DMA EN</u>	8	DMA Enable Register
A0090050	<u>RXTR AD</u>	8	Rx Trigger Address
A0090054	<u>FRACDIV L</u>	8	Fractional Divider LSB Address
A0090058	<u>FRACDIV M</u>	8	Fractional Divider MSB Address
A009005C	<u>FCR RD</u>	8	FIFO Control Register

A0090000	<u>RBR</u>	RX Buffer Register														00
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
--------	------	-------------

Bit(s)	Name	Description
7:0	RBR	Read-only register The received data can be read by accessing this register. Only when LCR[7] = 0.

A0090000 THR TX Holding Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	THR	TX Holding Register Write-only register. The data to be transmitted are written to this register and sent to the PC via serial communication. Only when LCR[7] = 0.

A0090000 DLL Divisor Latch (LS) 01

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	1

Bit(s)	Name	Description
7:0	DLL	Divisor latch low 8-bit data <i>Note: Modified when LCR[7]! = 0.</i>

A0090004 IER Interrupt Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									CTSI	RTSI	XOFF		EDSSI	ELSI	ETBEI	ERBFI
Type									RW	RW	RW		RW	RW	RW	RW
Reset									0	0	0		0	0	0	0

Bit(s)	Name	Description
7	CTSI	Masks an interrupt that is generated when a rising edge is detected on the CTS modem control line. <i>Note: This interrupt is only enabled when hardware flow control is enabled.</i> 0: Mask an interrupt that is generated when a rising edge is detected on the CTS modem control line. 1: Unmask an interrupt that is generated when a rising edge is detected on the CTS modem control line.
6	RTSI	Masks an interrupt that is generated when a rising edge is detected on the RTS modem control line. <i>Note: This interrupt is only enabled when hardware flow control is enabled.</i> 0: Mask an interrupt that is generated when a rising edge is detected on the RTS modem control line. 1: Unmask an interrupt that is generated when a rising edge is detected on the

Bit(s)	Name	Description
5	XOFFI	RTS modem control line. Masks an interrupt that is generated when an XOFF character is received. <i>Note: This interrupt is only enabled when software flow control is enabled.</i> 0: Mask an interrupt that is generated when an XOFF character is received. 1: Unmask an interrupt that is generated when an XOFF character is received.
3	EDSSI	When set to 1, an interrupt will be generated if DCTS (MSR[0]) becomes set. 0: No interrupt is generated if DCTS (MSR[0]) becomes set. 1: An interrupt is generated if DCTS (MSR[0]) becomes set.
2	ELSI	When set to 1, an interrupt will be generated if BI, FE, PE or OE (LSR[4:1]) becomes set. 0: No interrupt is generated if BI, FE, PE or OE (LSR[4:1]) becomes set. 1: An interrupt is generated if BI, FE, PE or OE (LSR[4:1]) becomes set.
1	ETBEI	When set to 1, an interrupt will be generated if the TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level. 0: No interrupt will be generated if the TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level. 1: An interrupt will be generated if the TX holding register is empty or the contents of the TX FIFO have been reduced to its trigger level.
0	ERBFI	When set to 1, an interrupt will be generated if RX data are placed in RX buffer register or the RX trigger level is reached. 0: No interrupt will be generated if RX data are placed in the RX buffer register or the RX trigger level is reached. 1: An interrupt will be generated if RX Data are placed in the RX buffer register or the RX trigger level is reached.

A0090004	<u>DLM</u>	Divisor Latch (MS)														00		
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
Name									DLM									
Type									RW									
Reset									0	0	0	0	0	0	0	0		

Bit(s)	Name	Description
7:0	DLM	Divisor latch high 8-bit data <i>Note: Modified when LCR[7]!=0. DLL & DLM can only be updated when DLAB(LCR[7]) is set to 1. Division by 1 will generate a BAUD signal that is constantly high. DLL & DLM setting formula is {DLH,DLL}=(system clock frequency/baud_pulse/baud_rate).</i> When RATE_FIX(RATEFIX_AD[0])=0, system clock frequency = 52MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=0, system clock frequency = 26MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=1, system clock frequency = 13MHz. For baud_pulse value, refer to HIGH_SPEED(offset=24H) register For example, when at 52MHz, default speed mode and 115200 baud rate, {DLH,DLL}=52MHz/16/115200=28.

A0090008 **IIR** Interrupt Identification Register 01

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name										FIFOE					ID	
Type										RO					RU	
Reset									0	0	0	0	0	0	0	1

Bit(s)	Name	Description
--------	------	-------------

7:6 FIFOE

5:0 ID

IIR[5:0] Priority level interrupt source

000001 No interrupt pending
000110 Line status interrupt:
BI, FE, PE or OE set in LSR. (Under IER[2]=1)
001100 RX data time-out:
Time-out on character in RX FIFO. (Under IER[0]=1)
000100 RX data received:
RX data received or RX trigger level reached. (Under IER[0]=1)
000010 TX holding register empty:
000000 Modem status change:
DCTS set in MSR. (Under IER[3]=1)
TX Holding Register empty or TX FIFO trigger level reached. (Under IER[1]=1)
010000 Software flow control:
XOFF Character received. (Under IER[5]=1)
100000 Hardware flow control:
CTS or RTS Rising Edge. (Under IER[7]=1 or IER[6]=1)

Line status interrupt: A RX line status interrupt (IIR[5:0] = 000110b) will be generated if ELSI (IER[2]) is set and any of BI, FE, PE or OE (LSR[4:1]) becomes set. The interrupt is cleared by reading the line status register.

RX data time-out interrupt: When the virtual FIFO mode is disabled, RX data time-out interrupt will be generated if all of the following conditions are applied:
1. FIFO contains at least one character.

- The most recent character is received longer than four character periods ago (including all start, parity and stop bits);
- The most recent CPU read of the FIFO is longer than four character periods ago.

The timeout timer is restarted upon receipt of a new byte from the RX shift register or upon a CPU read from the RX FIFO. The RX data time-out interrupt is enabled by setting EFRBI (IER[0]) to 1 and is cleared by reading RX FIFO.

When the virtual FIFO mode is enabled, RX data time-out interrupt will be generated if all of the following conditions are applied:
1. FIFO is empty.
2. The most recent character is received longer than four character periods ago (including all start, parity and stop bits).
3. The most recent CPU read of the FIFO is longer than four character periods ago.

The timeout timer is restarted upon receipt of a new byte from the RX shift register or reading DMA_EN register. The RX Data Timeout Interrupt is enabled by setting EFRBI (IER[0]) to 1 and is cleared by reading DMA_EN register.

RX data received interrupt: A RX received interrupt (IER[5:0] = 000100b) is generated if EFRBI (IER[0]) is set and either RX data are placed in the RX buffer register or the RX trigger level is reached. The interrupt is cleared by

Bit(s)	Name	Description
		reading the RX buffer register or the RX FIFO (if enabled).
		TX holding register empty interrupt: A TX holding register empty interrupt (IIR[5:0] = 000010b) is generated if ETRBI (IER[1]) is set and either the TX holding register is empty or the contents of the TX FIFO are reduced to its trigger level. The interrupt is cleared by writing to the TX holding register or TX FIFO if FIFO is enabled.
		Modem status change interrupt: A modem status change Interrupt (IIR[5:0] = 000000b) will be generated if EDSSI (IER[3]) is set and e DCTS (MSR[3:0]) becomes set. The interrupt is cleared by reading the modem status register.
		Software flow control interrupt: A software flow control interrupt (IIR[5:0] = 010000b) will be generated if the software flow control is enabled and XOFF1 (IER[5]) becomes set, indicating that an XOFF character has been received. The interrupt is cleared by reading the interrupt identification register.
		Hardware flow control interrupt: A hardware flow control interrupt (IER[5:0] = 100000b) will be generated if the hardware flow control is enabled and either RTSI (IER[6]) or CTSI (IER[7]) becomes set indicating that a rising edge has been detected on either the RTS/CTS modem control line. The interrupt is cleared by reading the interrupt identification register.

A0090008 FCR FIFO Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1_RFTL		TFTL1_TFTL			CLRT	CLRR	FIFOE
Type									0		0			WO	WO	WO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description
7:6	RFTL1_RFTL0	RX FIFO trigger threshold RX FIFO contains total 32 bytes. 0: 1 1: 6 2: 12 3: RXTRIG
5:4	TFTL1_TFTL0	TX FIFO trigger threshold TX FIFO contains total 32 bytes. 0: 1 1: 4 2: 8 3: 14
2	CLRT	Control bit to clear TX FIFO 0: No effect 1: Clear TX FIFO
1	CLRR	Control bit to clear RX FIFO 0: No effect 1: Clear RX FIFO
0	FIFOE	Enables FIFO This bit must be set to 1 for any of other bits in the registers to have any effect. 0: Disable both RX and TX FIFOs. 1: Enable both RX and TX FIFOs.

A0090008 EFR Enhanced Feature Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									AUTO_CTS	AUTO_RTS		ENABLE_E	SW_FLOW_CONT			
Type									RW	RW		RW	RW			
Reset									0	0		0	0	0	0	0

Bit(s)	Name	Description
7	AUTO_CTS	Enables hardware transmission flow control 0: Disable 1: Enable
6	AUTO_RTS	Enables hardware reception flow control 0: Disable 1: Enable
4	ENABLE_E	Enables enhancement feature 0: Disable 1: Enable
3:0	SW_FLOW_CONT	Software flow control bits 00xx: No TX flow control 01xx: No TX flow control 10xx: Transmit XON1/XOFF1 as flow control bytes xx00: No RX flow control xx01: No RX flow control xx10: Receive XON1/XOFF1 as flow control bytes

A009000C LCR Line Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLAB	SB	SP	EPS	PEN	STB	WLS1	WLS0
Type									RW	RW	RW	RW	RW	RW	RW	
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	DLAB	Divisor latch access bit 0: RX and TX registers are read/written at Address 0 and the IER register is read/written at Address 4. 1: Divisor Latch LS is read/written at Address 0 and the Divisor Latch MS is read/written at Address 4.
6	SB	Set break 0: No effect 1: SOUT signal is forced to the 0 state.
5	SP	Stick parity 0: No effect. 1: The parity bit is forced to a defined state, depending on the states of EPS and PEN: If EPS=1 & PEN=1, the parity bit will be set and checked = 0. If EPS=0 & PEN=1, the parity bit will be set and checked = 1.
4	EPS	Selects even parity 0: When EPS=0, an odd number of ones is sent and checked. 1: When EPS=1, an even number of ones is sent and checked.

Bit(s)	Name	Description
3	PEN	Enables parity 0: The parity is neither transmitted nor checked. 1: The parity is transmitted and checked.
2	STB	Number of STOP bits 0: One STOP bit is always added. 1: Two STOP bits are added after each character is sent; unless the character length is 5 when 1 STOP bit is added.
1:0	WLS1_WLS0	Selects word length 0: 5 bits 1: 6 bits 2: 7 bits 3: 8 bits

A0090010 MCR Modem Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XOFF_STAT US			Loop			RTS	
Type									RU			RW			RW	
Reset									0			0			0	

Bit(s)	Name	Description
7	XOFF_STATUS	Read-only bit 0: When an XON character is received. 1: When an XOFF character is received.
4	Loop	Loop-back control bit 0: No loop-back is enabled. 1: Loop-back mode is enabled.
1	RTS	Controls the state of the output NRTS, even in loop mode. 0: RTS will always output 1. 1: RTS's output will be controlled by flow control condition.

A0090010 XON1 XON1 Char Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XON1							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	XON1	XON1 character for software flow control Modified only when LCR=BF'h.

A0090014 LSR Line Status Register 60

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FIFOE RR	TEMT	THRE	BI	FE	PE	OE	DR

Type									RU	RU	RU	RU	RU	RU	RU	RU
Reset									0	1	1	0	0	0	0	0

Bit(s)	Name	Description
7	FIFOERR	RX FIFO error indicator 0: No PE, FE, BI set in the RX FIFO. 1: Set to 1 when there is at least one PE, FE or BI in the RX FIFO.
6	TEMT	TX holding register (or TX FIFO) and the TX shift register are empty. 0: Empty conditions below are not met. 1: If FIFOs are enabled, the bit will be set whenever the TX FIFO and the TX shift register are empty. If FIFOs are disabled, the bit will be set whenever TX holding register and TX shift register are empty.
5	THRE	Indicates if there is room for TX holding register or TX FIFO is reduced to its trigger level 0: Reset whenever the contents of the TX FIFO are more than its trigger level (FIFOs are enabled), or whenever TX holding register is not empty (FIFOs are disabled). 1: Set whenever the contents of the TX FIFO are reduced to its trigger level (FIFOs are enabled), or whenever TX holding register is empty and ready to accept new data (FIFOs are disabled).
4	BI	Break interrupt 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit will be set whenever the SIN is held in the 0 state for more than one transmission time (START bit + DATA bits + PARITY + STOP bits). If the FIFOs are enabled, this error will be associated with a corresponding character in the FIFO and is flagged when this byte is at the top of the FIFO. When a break occurs, only one zero character is loaded into the FIFO: The next character transfer is enabled when SIN goes into the marking state and receives the next valid start bit.
3	FE	Framing error 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit will be set if the received data do not have a valid STOP bit. If the FIFOs are enabled, the state of this bit will be revealed when the byte it refers to is the next to be read.
2	PE	Parity error 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit will be set if the received data do not have a valid parity bit. If the FIFOs are enabled, the state of this bit will be revealed when the referred byte is the next to be read.
1	OE	Overrun error 0: Reset by the CPU reading this register. 1: If the FIFOs are disabled, this bit will be set if the RX buffer is not read by the CPU before the new data from the RX shift register overwrites the previous contents. If the FIFOs are enabled, an overrun error will occur when the RX FIFO is full and the RX shift register becomes full. OE will be set as soon as this happens. The character in the shift register is then overwritten, but not transferred to the FIFO.
0	DR	Data ready 0: Cleared by the CPU reading the RX buffer or by reading all the FIFO bytes. 1: Set by the RX buffer becoming full or by the FIFO becoming no empty.

A0090018 XOFF1

XOFF1 Char Register

00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XOFF1							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	XOFF1	XOFF1 character for software flow control Modified only when LCR=BF'h.

A009001C SCR Scratch Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SCR							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SCR	General purpose read/write register After reset, its value will be undefined. Modified when LCR != BF'h.

A0090020 AUTOBAUD_EN Auto Baud Detect Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														SLEEP_ACK_SEL	AUTOBAUD_SEL	AUTOBAUD_EN
Type														RW	RW	RW
Reset														0	0	0

Bit(s)	Name	Description
2	SLEEP_ACK_SEL	Selects sleep ack when autobaud_en 0: Support sleep_ack when autobaud_en is opened. 1: Does not support sleep_ack when autobaud_en is opened.
1	AUTOBAUD_SEL	Selects auto-baud 0: Support standard baud rate detection 1: Support non_standard baud rate detection (support baud from 110 to 115200; recommended to use 52MHz to auto fix).
0	AUTOBAUD_EN	Auto-baud enabling signal 0: Disable auto-baud function 1: Enable auto-baud function (UARTn+0024h SPEED should be set to 0.) <i>Note: When AUTOBAUD_EN is active, there should not be A*/a* char before the auto baud char AT/at. If A*/a* is inevitable, autobaud will fail and please disable AUTOBAUD_EN to reset the autobaud feature and autobaud_en again.</i>

A0090024 HIGHSPEED High Speed Mode Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															SPEED	
Type															RW	
Reset															0	0

Bit(s)	Name	Description
1:0	SPEED	UART sample counter base 0: Based on 16*baud_pulse, baud_rate = system clock frequency/16/{DLH, DLL} 1: Based on 8*baud_pulse, baud_rate = system clock frequency/8/{DLH, DLL} 2: Based on 4*baud_pulse, baud_rate = system clock frequency/4/{DLH, DLL} 3: Based on sampe_count * baud_pulse, baud_rate = system clock frequency / (sampe_count+1)/{DLM, DLL}

A0090028 SAMPLE_COUN **I** Sample Counter Register **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SAMPLECOUNT	Only useful w hen HIGHSPEED mode = 3.

A009002C SAMPLE_POINT **I** Sample Point Register **FF**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	SAMPLEPOINT	SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 without decimal. Effective only w hen HIGHSPEED=3.

A0090030 AUTOBAUD_RE **G** Auto Baud Monitor Register **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:4	BAUD_STAT	Autobaud state (only true value in standard autobaud detection) 0: Autobaud is detecting. 1: AT_7N1 2: AT_7O1 3: AT_7E1 4: AT_8N1 5: AT_8O1 6: AT_8E1 7: at_7N1

Bit(s)	Name	Description
		8: at_7E1
		9: at_7O1
		10: at_8N1
		11: at_8E1
		12: at_8O1
		13: Autobaud detection fails
3:0	BAUD_RATE	Autobaud baud rate (only true value in standard autobaud detection)
		0: 115,200
		1: 57,600
		2: 38,400
		3: 19,200
		4: 9,600
		5: 4,800
		6: 2,400
		7: 1,200
		8: 300
		9: 110

A0090034 RATEFIX_AD Clock Rate Fix Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														FREQ_SEL	AUTO BAUD RATE_FIX	RATE_FIX
Type														RW	RW	RW
Reset														0	0	0

Bit(s)	Name	Description
2	FREQ_SEL	0: Select 26MHz as system clock 1: Select 13MHz as system clock
1	AUTOBAUD_RATE_FIX	0: Use 52MHz as system clock for UART auto baud detection 1: Use 26MHz/13MHz (depending on FREQ_SEL) as system clock for UART auto baud detection
0	RATE_FIX	0: Use 52MHz as system clock for UART TX/RX 1: Use 26MHz/13MHz (depending on FREQ_SEL) as system clock for UART TX/RX

A0090038 AUTOBAUDSAMPLE Auto Baud Sample Register 0D

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											AUTOBAUDSAMPLE					
Type											RW					
Reset											0	0	1	1	0	1

Bit(s)	Name	Description
		clk diveision for autobaud rate detection
5:0	AUTOBAUDSAMPLE	For standard baud rate detection. System clk 52m: 'd 27 System clk 26m: 'd 13 System clk 13m: 'd 6

Bit(s)	Name	Description
		For non-standard baud rate detection.

A009003C GUARD Guard Time Added Register 0F

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												GUARD_EN	GUARD_CNT			
Type												RW	RW			
Reset												0	1	1	1	1

Bit(s)	Name	Description
4	GUARD_EN	Guard interval add enabling signal 0: No guard interval added 1: Add guard interval after stop bit.
3:0	GUARD_CNT	Guard interval count value Guard interval = $[1/(\text{system clock}/\text{div_step}/\text{div})] * \text{GUARD_CNT}$.

A0090040 ESCAPE_DAT Escape Character Register FF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									ESCAPE_DAT							
Type									RW							
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	ESCAPE_DAT	Escape character added before software flow control data and escape character If TX data are xon (31h), with esc_en =1, UART will transmit data as esc + CEh (~xon).

A0090044 ESCAPE_EN Escape Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																ESC_EN
Type																RW
Reset																0

Bit(s)	Name	Description
0	ESC_EN	Adds escape character in transmitter and removes escape character in receiver by UART 0: Does not deal with the escape character 1: Add escape character in transmitter and remove escape character in receiver

A0090048 SLEEP_EN Sleep Enable Register

00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SLEEP_EN
Type																RW
Reset																0

Bit(s)	Name	Description
0	SLEEP_EN	For sleep mode issue 0: Does not deal with sleep mode indicate signal 1: Activate hardware flow control or software control according to software initial setting when the chip enters sleep mode. Release hardware flow when the chip wakes up. However, for software control, UART sends xon when awoken and when FIFO does not reach threshold level.

A009004C DMA_EN DMA Enable Register

00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													FIFO_LSR_sel	TO_CNT_AUTORST	TX_DMA_EN	RX_DMA_EN
Type													RW	RW	RW	RW
Reset													0	0	0	0

Bit(s)	Name	Description
3	FIFO_LSR_sel	Selects FIFO LSR mode 0: LSR will hold the first line status error state until you read the LSR register. 1: LSR will update automatically.
2	TO_CNT_AUTORST	Time-out counter auto reset register 0: After RX time-out happens, SW shall reset the interrupt by reading UART 0x4C. 1: The time-out counter will be auto reset. Set this register when Rain's new DMA is used.
1	TX_DMA_EN	TX_DMA mechanism enabling signal 0: Does not use DMA in TX 1: Use DMA in TX. When this register is enabled, the flow control will be based on the DMA threshold and generate a time-out interrupt for DMA.
0	RX_DMA_EN	RX_DMA mechanism enabling signal 0: Does not use DMA in RX 1: Use DMA in RX. When this register is enabled, the flow control will be based on the DMA threshold and generate a time-out interrupt

A0090050 RXTRIG_AD Rx Trigger Address

00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													RXTRIG			
Type													RW			
Reset													0	0	0	0

Bit(s)	Name	Description
--------	------	-------------

Bit(s)	Name	Description
3:0	RXTRIG	When {rtm,rtl}=2'b11, the RX FIFO threshold will be Rxtrig. The value is suggested to be smaller than half of RX FIFO size, which is 32 bytes.

A0090054 FRACDIV_L Fractional Divider LSB Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	FRA CDIV_L	Adds sampling count (+1) from state data7 to data0 to contribute fractional divisor.only w hen high_speed=3.

A0090058 FRACDIV_M Fractional Divider MSB Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset															0	0

Bit(s)	Name	Description
1:0	FRA CDIV_M	Adds sampling count when in state stop to parity to contribute fractional divisor.only w hen high_speed=3.

A009005C FCR_RD FIFO Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1_RFTL		TFTL1_TFTL			CLRT	CLRR	FIFOE
Type									0		0			RO	RO	RO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description
7:6	RFTL1_RFTL0	RX FIFO trigger threshold RX FIFO contains total 32 bytes. 0: 1 1: 6 2: 12 3: RXTRIG
5:4	TFTL1_TFTL0	TX FIFO trigger threshold TX FIFO contains total 32 bytes. 0: 1 1: 4 2: 8 3: 14
2	CLRT	0: TX FIFO is not cleared. 1: TX FIFO is cleared.

Bit(s)	Name	Description
1	CLRR	0: RX FIFO is not cleared. 1: RX FIFO is cleared.
0	FIFOE	Enables FIFO This bit must be set to 1 for any of other bits in the registers to have any effect. 0: RX and TX FIFOs are not enabled. 1: RX and TX FIFOs are enabled.

3.9 UART3

3.9.1 General Description

The baseband chipset houses two UARTs. The UARTs provide full duplex serial communication channels between baseband chipset and external devices.

The UART has M16C450 and M16550A modes of operation, which are compatible with a range of standard software drivers. The extensions have been designed to be broadly software compatible with 16550A variants, but certain areas offer no consensus.

In common with the M16550A, the UART supports word lengths **from 5 to 8 bits, an optional parity bit** and one or two stop bits, and is fully programmable by an 8-bit CPU interface. A 16-bit programmable baud rate generator and an 8-bit scratch register are included, together with separate transmit and receive FIFOs. Eight modem control lines and a diagnostic loop-back mode are provided. The UART also includes two DMA handshake lines, used to indicate when the FIFOs are ready to transfer data to the CPU. Interrupts can be generated from any of the 10 sources.

Note: The UART has been designed so that all internal operations are synchronized by the CLK signal. This synchronization results in minor timing differences between the UART and the industry standard 16550A device, which means that the core is not clock for clock identical to the original device.

After a hardware reset, the UART is in M16C450 mode. Its FIFOs can be enabled and the UART can then enter M16550A mode. The UART adds further functionality beyond M16550A mode. Each of the extended functions can be selected individually under software control.

The UART provides more powerful enhancements than the industry-standard 16550:

Note: In order to enable any of the enhancements, the Enhanced Mode bit, EFR[4], must be set. If EFR[4] is not set, IER[7:5], FCR[5:4], IIR[5:4] and MCR[7:6] cannot be written. The Enhanced Mode bit ensures that the UART is backward compatible with software that has been written for 16C450 and 16550A devices.

Figure 35 shows the block diagram of the UART3 device.

Figure 37. Block Diagram of UART3

3.9.2 Register Definitions

Module name: UART3 Base address: (+A00A0000h)

Address	Name	Width	Register Function
A00A0000	RBR	8	RX Buffer Register *NOTE:only when LCR[7] = 0.
A00A0000	THR	8	TX Holding Register *NOTE:only when LCR[7] = 0.
A00A0000	DLL	8	Divisor Latch (LS) used to divid the bdk frequency . *NOTE: modified when LCR[7] !=0
A00A0004	IER	8	Interrupt Enable Register *NOTE:only when LCR[7] = 0. By storing a '1' to a specfic bit position, the interrupt associated with that bit is enabled. Otherwise, the interrupt is disabled. IER[3:0] are modified when LCR[7] = 0. IER[7:4] are modified when LCR[7] = 0 & EFR[4] = 1.
A00A0004	DLM	8	Divisor Latch (MS) used to divid the bdk frequency . *NOTE: modified when LCR[7] !=0
A00A0008	IIR	8	Interrupt Identification Register *NOTE:only when LCR !=BFh. priority is from high to low as following .IIR[5:0]=0X1: no interrupt pending .IIR[5:0]=0X6:line status interup(Under IER[2]=1). IIR[5:0]=0Xc:rx data timeout interup(Under IER[0]=1). IIR[5:0]=0X4:RX Data is placed in the RX Buffer Register or the RX Trigger Level is reached.(Under IER[0]=1) IIR[5:0]=0X2: TX Holding Register is empty or the contents of the TX FIFO have been reduced to its Trigger Level(Under IER[1]=1). IIR[5:0]=0X10: XOFF character redeved (Under IER[5]=1,EFR[4] = 1).
A00A0008	FCR	8	FIFO Control Register FCR is used to control the trigger levels of the FIFOs, or flush the FIFOs. FCR[7:6] is modified when LCR != BFh FCR[5:4] is modified when LCR != BFh & EFR[4] = 1 FCR[4:0] is modified when LCR != BFh
A00A0008	EFR	8	Enhanced Feature Register *NOTE: Only when LCR=BFh
A00A000C	LCR	8	Line Control Register Line Control Register. Determines characteristics of serial communication signals.

A00A0010	<u>MCR</u>	8	Modem Control Register Modem Control Register. Control interface signals of the UART. MCR[5:0] are modified when LCR != 8'hBF. MCR[7] can be read when LCR != 8'hBF & EFR[4] = 1.
A00A0010	<u>XON1</u>	8	XON1 Char Register *Note: XON1 modified only when LCR=BF'h.
A00A0014	<u>LSR</u>	8	Line Status Register Line Status Register. Modified when LCR != BF'h.
A00A0018	<u>XOFF1</u>	8	XOFF1 Char Register *Note: , XOFF1 modified only when LCR=BF'h.
A00A001C	<u>SCR</u>	8	Scratch Register A general purpose read/write register. After reset, its value is un-defined. Modified when LCR != BF'h.
A00A0020	<u>AUTOBAUD_EN</u>	8	Auto Baud Detect Enable Register
A00A0024	<u>HIGHSPEED</u>	8	High Speed Mode Register
A00A0028	<u>SAMPLE_COUNT</u>	8	Sample Counter Register When HIGHSPEED=3, the sample_count is the threshold value for UART sample counter (sample_num). Count from 0 to sample_count.
A00A002C	<u>SAMPLE_POINT</u>	8	Sample Point Register When HIGHSPEED=3, UART gets the input data when sample_count=sample_num. e.g. system clock = 13MHz, 921600 = 13000000 / 14 sample_count = 13 and sample point = 6 (sample the central point to decrease the inaccuracy) The SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 and remove the decimal.
A00A0030	<u>AUTOBAUD_REG</u>	8	Auto Baud Monitor Register the autobaud detection state ,it will not change until enable the autobaud_en again.
A00A0034	<u>RATEFIX_AD</u>	8	Clock Rate Fix Register
A00A0038	<u>AUTOBAUDSAMPLE</u>	8	Auto Baud Sample Register Since the system dock may change, autobaud sample duration should change as system dock changes. When system clock = 13MHz, autobaudsample = 6; when system clock = 26MHz, autobaudsample = 13;When system dock = 52MHz, autobaudsample = 27.
A00A003C	<u>GUARD</u>	8	Guard time added register
A00A0040	<u>ESCAPE_DAT</u>	8	Escape character register
A00A0044	<u>ESCAPE_EN</u>	8	Escape enable register
A00A0048	<u>SLEEP_EN</u>	8	Sleep enable register
A00A004C	<u>DMA_EN</u>	8	DMA enable register
A00A0050	<u>RXTRI_AD</u>	8	Rx Trigger Address
A00A0054	<u>FRACDIV_L</u>	8	Fractional Divider LSB Address
A00A0058	<u>FRACDIV_M</u>	8	Fractional Divider MSB Address
A00A005C	<u>FCR_RD</u>	8	FIFO Control Register

A00A0000		<u>RBR</u>	RX Buffer Register												00	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RBR							
Type									RU							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	RBR	Read-only register. The received data can be read by accessing this register. Only when LCR[7] = 0.

A00A0000 THR TX Holding Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	THR	TX Holding Register. Write-only register. The data to be transmitted is written to this register, and then sent to the PC via serial communication. only when LCR[7] = 0.

A00A0000 DLL Divisor Latch (LS) 01

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	1

Bit(s)	Name	Description
7:0	DLL	divisor Latch low 8bit data. *NOTE: modified when LCR[7]!=0

A00A0004 IER Interrupt Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											XOFFI			ELSI	ETBEI	ERBFI
Type											RW			RW	RW	RW
Reset											0			0	0	0

Bit(s)	Name	Description
--------	------	-------------

5 XOFFI Masks an interrupt that is generated when an XOFF character is received.
Note: This interrupt is only enabled when software flow control is enabled.
0: Mask an interrupt that is generated when an XOFF character is received.
1: Unmask an interrupt that is generated when an XOFF character is received.

2 ELSI When set ("1"), an interrupt is generated if BI, FE, PE or OE (LSR[4:1]) becomes set.
0: No interrupt is generated if BI, FE, PE or OE (LSR[4:1]) becomes set.
1: An interrupt is generated if BI, FE, PE or OE (LSR[4:1]) becomes set.

1 ETBEI When set ("1"), an interrupt is generated if the TX Holding Register is empty or the contents of the TX FIFO have been reduced to its Trigger Level.
0: No interrupt is generated if the TX Holding Register is empty or the contents of the TX FIFO have been reduced to its Trigger Level.
1: An interrupt is generated if the TX Holding Register is empty or the contents of the TX FIFO have been reduced to its Trigger Level.

0 ERBFI

When set ("1"), an interrupt is generated if RX Data is placed in the RX Buffer Register or the RX Trigger Level is reached.

0: No interrupt is generated if RX Data is placed in the RX Buffer Register or the RX Trigger Level is reached.

1: An interrupt is generated if RX Data is placed in the RX Buffer Register or the RX Trigger Level is reached.

A00A0004 DLM Divisor Latch (MS) 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLM							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	DLM	divisor Latch high 8bit data.. *NOTE: modified when LCR[7]! =0 Note: DLL & DLM can only be updated when DLAB(LCR[7]) is set to 1, Note to that division by 1 generates a BAUD signal that is constantly high. Note: DLL & DLM setting formula is {DLH,DLL}=(system clock frequency/baud_pulse/baud_rate). When RATE_FIX(RATEFIX_AD[0])=0, system clock frequency = 52MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=0, system clock frequency = 26MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=1, system clock frequency = 13MHz. For baud_pulse value refer to HIGH_SPEED(offset=24H) register. e.g. When 52MHz,default speed mode and 115200 baud rate, the {DLH,DLL}=52MHz/16/115200=28.

A00A0008 IIR Interrupt Identification Register 01

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FIFOE		ID					
Type									RO		RU					
Reset									0	0	0	0	0	0	0	1

Bit(s)	Name	Description
7:6	FIFOE	
5:0	ID	IIR[5:0] Priority Level Interrupt Source 000001 - No interrupt pending 000110 1 Line Status Interrupt: (Under IER[2]=1) 001100 2 RX Data Timeout: (Under IER[0]=1) 000100 3 RX Data Received: (Under IER[0]=1) 000010 4 TX Holding Register Empty: (Under IER[0]=1) 000000 5 Modem Status change: (Under IER[3]=1) 010000 6 TX Holding Register empty or TX FIFO Trigger Level reached. (Under IER[1]=1) 010000 6 Software Flow Control: (Under IER[5]=1) 100000 7 Hardware Flow Control: (Under IER[7]=1 or IER[6]=1) CTS or RTS Rising Edge. (Under IER[7]=1 or IER[6]=1)

Line Status Interrupt: A RX Line Status Interrupt (IIR[5:0] == 000110b) is generated if ELSI (IER[2]) is set and any of BI, FE, PE or OE (LSR[4:1]) becomes set. The interrupt is cleared by reading the Line Status Register.

RX Data Timeout Interrupt: When virtual FIFO mode is disabled, RX Data Timeout Interrupt is generated if all of the following apply:

1. FIFO contains at least one character;
 2. The most recent character was received longer than four character periods ago (including all start, parity and stop bits);
 3. The most recent CPU read of the FIFO was longer than four character periods ago.
- The timeout timer is restarted on receipt of a new byte from the RX Shift Register, or on a CPU read from the RX FIFO.
- The RX Data Timeout Interrupt is enabled by setting EFRBI (IER[0]) to 1, and is cleared by reading RX FIFO.

When virtual FIFO mode is enabled, RX Data Timeout Interrupt is generated if all of the following apply:

1. FIFO is empty;
 2. The most recent character was received longer than four character periods ago (including all start, parity and stop bits);
 3. The most recent CPU read of the FIFO was longer than four character periods ago.
- The timeout timer is restarted on receipt of a new byte from the RX Shift Register or reading DMA_EN register.
- The RX Data Timeout Interrupt is enabled by setting EFRBI (IER[0]) to 1, and is cleared by reading DMA_EN register.

RX Data Received Interrupt: A RX Received interrupt (IER[5:0] == 000100b) is generated if EFRBI (IER[0]) is set and either RX Data is placed in the RX Buffer Register or the RX Trigger Level is reached. The interrupt is cleared by reading the RX Buffer Register or the RX FIFO (if enabled).

TX Holding Register Empty Interrupt: A TX Holding Register Empty Interrupt (IIR[5:0] = 000010b) is generated if ETRBI (IER[1]) is set and either the TX Holding Register is empty or the contents of the TX FIFO have been reduced to its Trigger Level. The interrupt is cleared by writing to the TX Holding Register or TX FIFO if FIFO enabled.

Modem Status Change Interrupt: A Modem Status Change Interrupt (IIR[5:0] = 000000b) is generated if EDSSI (IER[3]) is set and e DCTS (MSR[3:0]) becomes set. The interrupt is cleared by reading the Modem Status Register.

Software Flow Control Interrupt: A Software Flow Control Interrupt (IIR[5:0] = 010000b) is generated if Software Flow Control is enabled and XOFFI (IER[5]) becomes set, indicating that an XOFF character has been received. The interrupt is cleared by reading the Interrupt Identification Register.

Hardware Flow Control Interrupt: A Hardware Flow Control Interrupt (IER[5:0] = 100000b) is generated if Hardware Flow Control is enabled and either RTSI (IER[6]) or CTSI (IER[7]) becomes set indicating that a rising edge has been detected on either the RTS/CTS Modem Control line. The interrupt is cleared by reading the Interrupt Identification Register.

A00A0008 FCR FIFO Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1_RFTL0		TFTL1_TFTL0			CLRT	CLRR	FIFOE
Type									WO		WO			WO	WO	WO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description	
7:6	RFTL1_RFTL0	RX FIFO trigger threshold. (RX FIFO contains total 32 bytes.)	
		0:	1
		1:	6
		2:	12
		3: RXTRIG	
5:4	TFTL1_TFTL0	TX FIFO trigger threshold (TX FIFO contains total 32 bytes.)	
		0:	1
		1:	4
		2:	8
		3: 14	

2	CLRT	control bit to clear tx fifo	0: no effect 1: clear TX FIFO
1	CLRR	control bit to clear rx fifo	0: no effect 1: clear RX FIFO
0	FIFOE	FIFO Enabled. This bit must be set to 1 for any of the other bits in the registers to have any effect.	0: Disable both the RX and TX FIFOs. 1: Enable both the RX and TX FIFOs.

A00A0008 EFR Enhanced Feature Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												ENABLE_E	SW_FLOW_CONT			
Type												RW	RW			
Reset												0	0	0	0	0

Bit(s)	Name	Description
4	ENABLE_E	Enables enhancement feature 0: Disabled. 1: Enabled.
3:0	SW_FLOW_CONT	Software flow control bits. 00xx: No TX Flow Control bytes 01xx: No TX Flow Control bytes 10xx: Transmit XON1/XOFF1 as flow control bytes xx00: No RX Flow Control xx01: No RX Flow Control xx10: Receive XON1/XOFF1 as flow control bytes

A00A000C LCR Line Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLAB	SB	SP	EPS	PEN	STB	WLS1	WLS0
Type									RW	RW	RW	RW	RW	RW	RW	RW
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	DLAB	Divisor Latch Access Bit. 0: The RX and TX Registers are read/written at Address 0 and the IER register is read/written at Address 4. 1: The Divisor Latch LS is read/written at Address 0 and the Divisor Latch MS is read/written at Address 4.
6	SB	Set Break 0: No effect 1: SOUT signal is forced into the "0" state.
5	SP	Stick Parity 0: No effect. 1: The Parity bit is forced into a defined state, depending on the states of EPS and PEN: If EPS=1 & PEN=1, the Parity bit is set and checked = 0. If EPS=0 & PEN=1, the Parity bit is set and checked = 1.
4	EPS	Even Parity Select

3 PEN

0: When EPS=0, an odd number of ones is sent and checked.
1: When EPS=1, an even number of ones is sent and checked.

Parity Enable

0: The Parity is neither transmitted nor checked.
1: The Parity is transmitted and checked.

2 STB

Number of STOP bits

0: One STOP bit is always added.
1: Two STOP bits are added after each character is sent; unless the character length is 5 when 1 STOP bit is added.

1:0 WLS1_WLS0

Word Length Select.

0: 5 bits
1: 6 bits
2: 7 bits
3: 8 bits

A00A0010 MCR Modem Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XOFF_STAT US			Loop				
Type									RU			RW				
Reset									0			0				

Bit(s)	Name	Description
7	XOFF_STATUS	This is a read-only bit. 0: When an XON character is received. 1: When an XOFF character is received.
4	Loop	Loop-back control bit. 0: No loop-back is enabled. 1: Loop-back mode is enabled.

A00A0010 XON1 XON1 Char Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XON1							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	XON1	XON1 character for software flow control. modified only when LCR=BFh.

A00A0014 LSR Line Status Register 60

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FIFOE RR	TEMT	THRE	BI	FE	PE	OE	DR
Type									RU	RU	RU	RU	RU	RU	RU	RU
Reset									0	1	1	0	0	0	0	0

Bit(s)	Name	Description
--------	------	-------------

7	FIFOERR	RX FIFO Error Indicator. 0: No PE, FE, BI set in the RX FIFO. 1: Set to 1 when there is at least one PE, FE or BI in the RX FIFO.
6	TEMT	TX Holding Register (or TX FIFO) and the TX Shift Register are empty. 0: Empty conditions below are not met. 1: If FIFOs are enabled, the bit is set whenever the TX FIFO and the TX Shift Register are empty. If FIFOs are disabled, the bit is set whenever TX Holding Register and TX Shift Register are empty.
5	THRE	Indicates if there is room for TX Holding Register or TX FIFO is reduced to its Trigger Level. 0: Reset whenever the contents of the TX FIFO are more than its Trigger Level (FIFOs are enabled), or whenever TX Holding Register is not empty (FIFOs are disabled). 1: Set whenever the contents of the TX FIFO are reduced to its Trigger Level (FIFOs are enabled), or whenever TX Holding Register is empty and ready to accept new data (FIFOs are disabled).
4	BI	Break Interrupt. 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit is set whenever the SIN is held in the 0 state for more than one transmission time (START bit + DATA bits + PARITY + STOP bits). If the FIFOs are enabled, this error is associated with a corresponding character in the FIFO and is flagged when this byte is at the top of the FIFO. When a break occurs, only one zero character is loaded into the FIFO: the next character transfer is enabled when SIN goes into the marking state and receives the next valid start bit.
3	FE	Framing Error. 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit is set if the received data did not have a valid STOP bit. If the FIFOs are enabled, the state of this bit is revealed when the byte it refers to is the next to be read.
2	PE	Parity Error 0: Reset by the CPU reading this register 1: If the FIFOs are disabled, this bit is set if the received data did not have a valid parity bit. If the FIFOs are enabled, the state of this bit is revealed when the referred byte is the next to be read.
1	OE	Overrun Error. 0: Reset by the CPU reading this register. 1: If the FIFOs are disabled, this bit is set if the RX Buffer was not read by the CPU before new data from the RX Shift Register overwrote the previous contents. If the FIFOs are enabled, an overrun error occurs when the RX FIFO is full and the RX Shift Register becomes full. OE is set as soon as this happens. The character in the Shift Register is then overwritten, but not transferred to the FIFO.
0	DR	Data Ready. 0: Cleared by the CPU reading the RX Buffer or by reading all the FIFO bytes. 1: Set by the RX Buffer becoming full or by the FIFO becoming no empty.

A00A0018	XOFF1	XOFF1 Char Register														00	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Name									XOFF1								
Type									RW								
Reset									0	0	0	0	0	0	0	0	

Bit(s)	Name	Description
7:0	XOFF1	XOFF1 character for software flow control. modified only when LCR=BFh.

A00A001C		<u>SCR</u>		Scratch Register												00	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Name								SCR							
Type								RW							
Reset								0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SCR	A general purpose read/write register. After reset, its value is un-defined. Modified when LCR != BFh.

A00A0020	AUTOBAUD EN Auto Baud Detect Enable Register	00
-----------------	---	-----------

[illegible]

Bit(s)	Name	Description
2	SLEEP_ACK_SEL	Sleep ack select when autobaud_en 0: support sleep_ack when autobaud_en is opened . 1: not support sleep_ack when autobaud_en is opened .
1	AUTOBAUD_SEL	Auto-baud select 0: support standard baud rate detection . 1: support non_standard baud rate detection(support baud from 110 to 115200, it is recommend to use 52MHZ to auto fix).
0	AUTOBAUD_EN	Auto-baud enable signal 0: Auto-baud function disable 1: Auto-baud function enable (UARTn+0024h SPEED should be set 0) Note: when AUTOBAUD_EN is active, there should not A*/a* char before the auto baud char AT/at, if the A*/a* is Inevitable, the autobaud will fail and please disable the AUTOBAUD_EN to reset the autobaud feature and autobaud_en again.

A00A0024	<u>HIGHSPEED</u>	High Speed Mode Register	00
-----------------	-------------------------	---------------------------------	-----------

[illegible]

Bit(s)	Name	Description
1:0	SPEED	UART sample counter base 0: based on 16*baud_pulse, baud_rate = system clock frequency/16/{DLH, DLL} 1: based on 8*baud_pulse, baud_rate = system clock frequency/8/{DLH, DLL} 2: based on 4*baud_pulse, baud_rate = system clock frequency/4/{DLH, DLL} 3: based on sample_count * baud_pulse, baud_rate = system clock frequency / (sample_count+1) / {DLM, DLL}

A00A0028	<u>SAMPLE COUN</u>	Sample Counter Register	00
----------	--------------------	-------------------------	----

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SAMPLECOUNT							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SAMPLECOUNT	Just be useful when HIGHSPEED mode = 3.

A00A002C SAMPLE_POINT Sample Point Register FF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SAMPLEPOINT							
Type									RW							
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	SAMPLEPOINT	The SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 and remove the decimal. sample point, is effective only When HIGHSPEED=3

A00A0030 AUTOBAUD_REG Auto Baud Monitor Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									BAUD_STAT				BAUD_RATE			
Type									RU				RU			
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:4	BAUD_STAT	Autobaud state(only true value in standard autobaud detection) 0: Autobaud is detecting 1: AT_7N1 2: AT_7O1 3: AT_7E1 4: AT_8N1 5: AT_8O1 6: AT_8E1 7: at_7N1 8: at_7E1 9: at_7O1 10: at_8N1 11: at_8E1 12: at_8O1 13: Autobaud detection fails
3:0	BAUD_RATE	Autobaud baud rate(only true value in standard autobaud detection) 0: 115200 1: 57600 2: 38400 3: 19200 4: 9600 5: 4800 6: 2400 7: 1200 8: 300 9: 110

A00A0034 RATEFIX_AD Clock Rate Fix Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														FREQ	AUTO	RATE

[illegible]

Bit(s)	Name	Description
2	FREQ_SEL	0: Select 26MHZ as system clock 1: Select 13MHZ as system dock
1	AUTOBAUD_RATE_FIX	0: Use 52MHZ as system clock for UART auto baud detect 1: Use 26MHZ/13MHZ(depends on FREQ_SEL) as system clock for UART auto baud detect
0	RATE_FIX	0: Use 52MHZ as system clock for UART TX/RX 1: Use 26MHZ/13MHZ(depends on FREQ_SEL) as system clock for UART TX/RX

A00A0038 **AUTOBAUDSA** Auto Baud Sample Register
MPLE

OD

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											AUTOBAUDSAMPLE					
Type											RW					
Reset											0	0	1	1	0	1

Bit(s)	Name	Description																														
5:0	AUTOBAUDSAMPLE	clk division for autobaud rate detection. <table><tr><td>for</td><td>standard</td><td>baud</td><td>rate</td><td>detection.</td></tr><tr><td>system</td><td>clk</td><td>52m</td><td>:d</td><td>27</td></tr><tr><td>system</td><td>clk</td><td>26m</td><td>:d</td><td>13</td></tr><tr><td>system</td><td>clk</td><td>13m</td><td>:d</td><td>6</td></tr><tr><td>for</td><td>non-standard</td><td>baud</td><td>rate</td><td>detection.</td></tr><tr><td>:15.</td><td></td><td></td><td></td><td></td></tr></table>	for	standard	baud	rate	detection.	system	clk	52m	:d	27	system	clk	26m	:d	13	system	clk	13m	:d	6	for	non-standard	baud	rate	detection.	:15.				
for	standard	baud	rate	detection.																												
system	clk	52m	:d	27																												
system	clk	26m	:d	13																												
system	clk	13m	:d	6																												
for	non-standard	baud	rate	detection.																												
:15.																																

A00A003C **GUARD** Guard time added register

OF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												GUARD_EN	GUARD_CNT			
Type												RW	RW			
Reset												0	1	1	1	1

Bit(s)	Name	Description
4	GUARD_EN	Guard interval add enable signal. 0: No guard interval added. 1: Add guard interval after stop bit.
3:0	GUARD_CNT	Guard interval count value. Guard interval = $(1/(\text{system clock} / \text{div_step} / \text{div})) * \text{GUARD_CNT}$.

A00A0040	<u>ESCAPE DAT</u>	Escape character register
-----------------	--------------------------	---------------------------

FF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									ESCAPE_DAT							
Type									RW							
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	ESCAPE_DAT	Escape character added before software flow control data and escape character, i.e. if tx data is xon (31h), with esc_en =1, uart transmits data as esc + CEh (~xon).

A00A0044 ESCAPE_EN Escape enable register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																ESC_EN
Type																RW
Reset																0

Bit(s)	Name	Description
0	ESC_EN	Add escape character in transmitter and remove escape character in receiver by UART. 0: Do not deal with the escape character. 1: Add escape character in transmitter and remove escape character in receiver.

A00A0048 SLEEP_EN Sleep enable register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SLEEP_EN
Type																RW
Reset																0

Bit(s)	Name	Description
0	SLEEP_EN	For sleep mode issue 0: Do not deal with sleep mode indicate signal 1: To activate hardware flow control or software control according to software initial setting when chip enters sleep mode. Releasing hardware flow when chip wakes up; but for software control, uart sends xon when awoken and when FIFO does not reach threshold level.

A00A004C DMA_EN DMA enable register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													FIFO_Isr_sel	TO_CNT_AUTORST	TX_DMA_EN	RX_DMA_EN
Type													RW	RW	RW	RW
Reset													0	0	0	0

Bit(s)	Name	Description
3	FIFO_Isr_sel	fifo isr mode selection 0: Isr will hold the first line status error state until you read the Isr register. 1: Isr will update automatically.
2	TO_CNT_AUTORST	Timeout counter auto reset register 0: After RX timeout happen, SW shall reset the interrupt by reading UART 0x4C. 1: The timeout counter will be auto reset. Set this register when Rain's new DMA is used.

1	TX_DMA_EN	TX_DMA mechanism enable signal 0: Do not use DMA in TX. 1: Use DMA in TX. When this register is enabled, the flow control is based on the DMA threshold, and generates a timeout interrupt for DMA.for DMA.
0	RX_DMA_EN	RX_DMA mechanism enable signal 0: Do not use DMA in RX. 1: Use DMA in RX. When this register is enabled, the flow control is based on the DMA threshold, and generates a timeout interrupt

A00A0050 RXTRI_AD Rx Trigger Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset													0	0	0	0

Bit(s)	Name	Description
3:0	RXTRIG	When {rtm,rtl}=2'b11, The Rx FIFO threshold will be Rxtrig. The value is suggested to be less than half of RX FIFO size, which is 32 Bytes.

A00A0054 FRACDIV_L Fractional Divider LSB Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	FRACDIV_L	Add sampling count (+1) from state data7 to data0, in order to contribute fractional divisor.only when high_speed==3.

A00A0058 FRACDIV_M Fractional Divider MSB Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset															0	0

Bit(s)	Name	Description
1:0	FRACDIV_M	Add sampling count when in state stop to parity, in order to contribute fractional divisor.only when high_speed==3.

A00A005C FCR_RD FIFO Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1_RFTL		TFTL1_TFTL			CLRT	CLRR	FIFOE
Type									RO		RO			RO	RO	RO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description	
7:6	RFTL1_RFTL0	RX FIFO trigger threshold. (RX FIFO contains total 32 bytes.) 0: 1: 2: 3: RXTRIG	1 6 12
5:4	TFTL1_TFTL0	TX FIFO trigger threshold (TX FIFO contains total 32 bytes.) 0: 1: 2: 3: 14	1 4 8
2	CLRT	0: TX FIFO is not cleared 1: TX FIFO is cleared	
1	CLRR	0: RX FIFO is not cleared 1: RX FIFO is cleared	
0	FIFOE	FIFO Enabled. This bit must be set to 1 for any of the other bits in the registers to have any effect. 0: the RX and TX FIFOs are not enabled.. 1: RX and TX FIFOs are enabled.	

3.10 I2C/SCCB Controller

3.10.1 General Description

I2C (Inter-IC)/SCCB (Serial Camera Control Bus) is a two-wire serial interface. The two signals are SCL and SDA. SCL is a clock signal that is driven by the master. SDA is a bi-directional data signal that can be driven by either the master or the slave. This generic controller supports the master role and conforms to the I2C specification.

3.10.1.1 Feature

- I2C compliant master mode operation
- Adjustable clock speed for LS/FS mode operation
- Supports 7-bit/10-bit addressing
- Supports high-speed mode
- Supports slave clock extension
- START/STOP/REPEATED START condition
- Manual transfer mode
- Multi-write per transfer (up to 8 data bytes for non-DMA mode)
- Multi-read per transfer (up to 8 data bytes for non-DMA mode)
- Multi-transfer per transaction
- Combined format transfer with length change capability
- Active drive/wired-and I/O configuration

3.10.1.2 Manual Transfer Mode

The controller offers one transfer mode, the manual mode.

When the manual mode is selected, in addition to the slave address register, the controller has a built-in 8byte deep FIFO which allows MCU to prepare up to 8 bytes of data for a write transfer, or read up to 8 bytes of data for a read transfer.

3.10.1.3 Transfer Format Support

This controller has been designed to be as generic as possible in order to support a wide range of devices that may utilize different combinations of transfer formats. Here are the transfer format types that can be supported through different software configuration:

Wording convention note

- Transfer = Anything encapsulated within a Start and Stop or Repeated Start.
- Transfer length = Number of bytes within the transfer
- Transaction = This is the top unit. Everything combined equals 1 transaction.
- Transaction length = Number of transfers to be conducted.

Single-byte access

Single Byte Write

Single Byte Read

Multi-byte access

Multi Byte Write

Multi Byte Read

Multi-byte transfer + multi-transfer (same direction)

Multi Byte Write + Multi Transfer

Multi Byte Read + Multi Transfer

Multi-byte transfer + multi-transfer w RS (same direction)

Multi Byte Write + Multi Transfer + Repeated Start

Multi Byte Read + Multi Transfer + Repeated Start

Combined write/read with Repeated Start (direction change)

Note: Only supports write and then read sequence. Read and then write is not supported.

Combined Multi Byte Write + Multi Byte Read

3.10.2 Programming Examples

Common transfer programmable parameters

Programmable Parameters

Output waveform timing programmable parameters

3.10.3 Register Definition

Module name: I2C_SCCB_Controller base address: (+A0120000h)

Address	Name	Width	Register function
A0120000	DATA_PORT	16	Data port register
A0120004	SLAVE_ADDR	16	Slave address register
A0120008	INTR_MASK	16	Interrupt mask register This register provides masks for the corresponding interrupt sources as indicated in the intr_stat register. 1 = Allow interrupt 0 = Disable interrupt <i>Note: While disabled, the corresponding interrupt will not be asserted, however intr_stat will still be updated with the status, i.e. mask does not affect intr_stat register values.</i>
A012000C	INTR_STAT	16	Interrupt status register When an interrupt is issued by the I2C controller, this register will need to be read by MCU to determine the cause for the interrupt. After this status has been read and appropriate actions are taken, the corresponding interrupt source will need to be written 1 to clear.
A0120010	CONTROL	16	Control register

Address	Name	Width	Register function
A0120014	TRANSFER_LEN	16	Transfer length register (number of bytes per transfer)
A0120018	TRANSAC_LEN	16	Transaction length register (number of transfers per transaction)
A012001C	DELAY_LEN	16	Inter delay length register
A0120020	TIMING	16	Timing control register LS/FS only. This register is used to control the output waveform timing. Each half pulse width, i.e. each high or low pulse, is equal to $(step_cnt_div+1)*(sample_cnt_div+1)/13MHz$
A0120024	START	16	Start register
A0120030	FIFO_STAT	16	FIFO status register
A0120038	FIFO_ADDR_CLR	16	FIFO address clear register
A0120040	IO_CONFIG	16	IO config register This register is used to configure the I/O for the SDA and SCL lines to select between normal I/O mode, or open-drain mode to support wired-and bus.
A0120048	HS	16	High speed mode register This register contains options for supporting high speed operation features. Each HS half pulse width, i.e. each high or low pulse, is equal to $(step_cnt_div+1)*(sample_cnt_div+1)/13MHz$
A0120050	SOFTRESET	16	Soft reset register
A0120060	SPARE	16	SPARE
A0120064	DEBUGSTAT	16	Debug status register
A0120068	DEBUGCTRL	16	Debug control register
A012006C	TRANSFER_LEN_A UX	16	Transfer length register (number of bytes per transfer)
A0120074	TIMEOUT	16	Timeout timing register

A0120000 [DATA_PORT](#) Data Port Register **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DATA_PORT							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
			FIFO access port
			During master write sequences (slave_addr[0] = 0), this port can be written by APB, and during master read sequences (slave_addr[0] = 1), this port can be read by APB.
7:0	DATA_PORT	DATA_PORT	Note: Slave_addr must be set correctly before accessing FIFO.

Bit(s)	Mnemonic	Name	Description
			For debugging only: If the fifo_apb_debug bit is set, FIFO can be read and written by the APB.

A0120004 SLAVE_ADDR Slave Address Register 00BF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									1	0	1	1	1	1	1	1

Bit(s)	Mnemonic	Name	Description
7:0	<u>SLAVE_ADDR</u>	SLAVE_ADDR	Specifies the slave address of the device to be accessed Bit 0 is defined by the I2C protocol as a bit that indicates the direction of transfer. 0: Master write 1: Master read

A0120008 INTR_MASK Interrupt Mask Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												<u>MASK_TIMEOUT</u>		<u>MASK_HS_NACKERR</u>	<u>MASK_ACKERR</u>	<u>MASK_TRANSAC_COMP</u>
Type												RW		RW	RW	RW
Reset												0		0	0	0

Overview: This register provides masks for the corresponding interrupt sources as indicated in the intr_stat register. 1 = allow interrupt; 0 = disable interrupt Note that while disabled, the corresponding interrupt will not be asserted. However, intr_stat will still be updated with the status, i.e. mask does not affect intr_stat register values.

Bit(s)	Mnemonic	Name	Description
4	<u>MASK_TIMEOUT</u>	MASK_TIMEOUT	Setting this value to 0 will mask TIMEOUT interrupt signal.
2	<u>MASK_HS_NACKERR</u>	MASK_HS_NACKERR	Setting this value to 0 will mask HS_NACKERR interrupt signal.
1	<u>MASK_ACKERR</u>	MASK_ACKERR	Setting this value to 0 will mask ACK_ERR interrupt signal.
0	<u>MASK_TRANSAC_COMP</u>	MASK_TRANSAC_COMP	Setting this value to 0 will mask TRANSAC_COMP interrupt signal.

A012000C INTR_STAT Interrupt Status Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												<u>TIMEOUT</u>	<u>ARB_LOST</u>	<u>HS_NACKERR</u>	<u>ACKERR</u>	<u>TRANSAC_COMP</u>
Type												W1C	W1C	W1C	W1C	W1C

Reset											0	0	0	0	0
-------	--	--	--	--	--	--	--	--	--	--	---	---	---	---	---

Overview: When an interrupt is issued by the I2C controller, this register will need to be read by MCU to determine the cause for the interrupt. After this status has been read and appropriate actions are taken, the corresponding interrupt source will need to be written 1 to clear.

Bit(s)	Mnemonic	Name	Description
4	TIMEOUT	TIMEOUT_IRQ	This status is asserted if time-out is enabled and the timer expires. The internal master state machine will stop, and MCU will need to manually clear the state machine by either issuing software reset by disabling the transact_en bit. Time-out can be used to detect PCB or I2C malfunction.
3	ARB_LOST	SPARE	Reserved
2	HS_NACKERR	HS_NACKERR	This status is asserted if HS master code NACK error detection is enabled. If enabled, HS master code NACK err will cause transaction to end, and stop will be issued.
1	ACKERR	ACKERR	This status is asserted if ACK error detection is enabled. If enabled, ACKERR will cause transaction to end, and stop will be issued.
0	TRANSAC_COMP	TRANSAC_COMP	This status is asserted when a transaction is completed successfully.

A0120010 **CONTROL** Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name								TIMEOUT_EN	RESET_BUSY_EN	TRANSFER_LEN_CHANGE	ACKERR_DET_EN	DIR_CHANGE	CLK_EXTEN		RS_STOP	
Type								RW	RW	RW	RW	RW	RW		RW	
Reset								0	0	0	0	0	0		0	

Bit(s)	Mnemonic	Name	Description
8	TIMEOUT_EN	TIMEOUT_EN	Enables time-out mechanism When enabled, if SCL stays at 0 for too long period of time due to I2C slave holds SCL at 0 for too long or SCL sticks at 0 due to PCB issue, the master shall terminate the transaction, stop the internal state machine and assert time-out interrupt. MCU shall handle this case appropriately and reset the master and FIFO address before reissuing the transaction again. If this option is disabled, the HW timer will not count and nor expire forever. 0: Disable 1: Enable
7	RESET_BUSY_EN	SPARE	Reserved
6	TRANSFER_LEN_CHANGE	TRANSFER_LEN_CHANGE	Specifies whether or not to change the transfer length after the first transfer is completed If enabled, the transfers after the first transfer will use the transfer_len_aux parameter. 0: Disable 1: Enable
5	ACKERR_DET_EN	ACKERR_DET_EN	Enables slave ACK error detection When enabled, if slave ACK error is detected, the master shall

Bit(s)	Mnemonic	Name	Description
			terminate the transaction by issuing a STOP condition and then assert the ACKERR interrupt. MCU handles this case appropriately then resets the FIFO address before reissuing transaction. If this option is disabled, the controller will ignore slave ACK error and keep on scheduled transaction. 0: Disable 1: Enable
4	DIR_CHANGE	DIR_CHANGE	Combined transfer format, where the direction of transfer is to be changed from write to read after the FIRST RS condition <i>Note: When set to 1, the transfers after the direction change will be based on the transfer_len_aux parameter.</i> 0: Disable 1: Enable
3	CLK_EXT_EN	CLK_EXT_EN	I2C spec allows slaves to hold the SCL line low if it is not yet ready for further processing Therefore, if this bit is set to 1, the master controller will enter a high wait state until the slave releases the SCL line.
1	RS_STOP	RS_STOP	In LS/FS mode, this bit affects multi-transfer transaction only. It controls whether or not the REPEATED-START condition is used between transfers. The last ending transfer always ends with a STOP. In HS mode, this bit must be set to 1. 0: Use STOP 1: Use REPEATED-START

A0120014 TRANSFER_LEN Transfer Length Register (Number of Bytes per Transfer) 0001

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													TRANSFER_LEN_AUX			
Type													RW			
Reset													0	0	0	1

Bit(s)	Mnemonic	Name	Description
3:0	TRANSFER_LEN_AUX	TRANSFER_LEN	Indicates the number of data bytes to be transferred in 1 transfer unit (excluding slave address byte) <i>Note: The value must be set to be bigger than 1; otherwise no transfer will take place.</i>

A0120018 TRANSAC_LEN Transaction Length Register (Number of Transfers per Transaction) 0001

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									TRANSAC_LEN							
Type									RW							
Reset									0	0	0	0	0	0	0	1

Bit(s)	Mnemonic	Name	Description
7:0	TRANSAC_LEN	TRANSAC_LEN	Indicates the number of transfers to be transferred in 1 transaction <i>Note: The value must be set to be bigger than 1; otherwise no</i>

Bit(s)	Mnemonic	Name	Description
transfer will take place.			

A012001C **DELAY_LEN** Inter Delay Length Register **0002**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DELAY_LEN							
Type									RW							
Reset									0	0	0	0	0	0	1	0

Bit(s)	Mnemonic	Name	Description
7:0	DELAY_LEN	DELAY_LEN	Sets up wait delay between consecutive transfers when RS_STOP bit is set to 0 Unit: Half the pulse width

A0120020 **TIMING** Timing Control Register **1303**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DATA_READ_ADJ	DATA_READ_TIME				SAMPLE_CNT_DIV					STEP_CNT_DIV					
Type	RW	RW				RW					RW					
Reset	0	0	0	1		0	1	1			0	0	0	0	1	1

Overview: LS/FS only. This register is used to control the output waveform timing. Each half pulse width, i.e. each high or low pulse, is equal to (step_cnt_div+1)*(sample_cnt_div + 1)/13MHz

Bit(s)	Mnemonic	Name	Description
15	DATA_READ_ADJ	DATA_READ_ADJ	When set to 1, data latch in sampling time during master reads are adjusted according to the DATA_READ_TIME value. Otherwise, by default, the data are latched in at half of the high pulse width point. This value must be set to be smaller than or equal to half the high pulse width.
14:12	DATA_READ_TIME	DATA_READ_TIME	This value is valid only when DATA_READ_ADJ is set to 1. This can be used to adjust so that the data are latched in at earlier sampling points (assuming data are settled by then).
10:8	SAMPLE_CNT_DIV	SAMPLE_CNT_DIV	Used for LS/FS only. This adjusts the width of each sample. Sample width = (sample_cnt_div + 1)/13MHz
5:0	STEP_CNT_DIV	STEP_CNT_DIV	Specifies the number of samples per half pulse width, i.e. each high or low pulse

A0120024 **START** Start Register **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																START
Type																RW
Reset																0

Bit(s)	Mnemonic	Name	Description
0	START	START	Starts the transaction on the bus It is auto de-asserted at the end of the transaction.

A0120030 **FIFO_STAT** **FIFO Status Register** **0001**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	RD_ADDR				WR_ADDR				FIFO_OFFSET						WR_FULL	RD_EMPTY
Type	RO				RU				RU						RO	RO
Reset	0	0	0	0	0	0	0	0	0	0	0	0			0	1

Bit(s)	Mnemonic	Name	Description
15:12	RD_ADDR	RD_ADDR	Current RD address pointer Only bit [2:0] have physical meanings.
11:8	WR_ADDR	WR_ADDR	Current WR address pointer Only bit [2:0] have physical meanings.
7:4	FIFO_OFFSET	FIFO_OFFSET	wr_addr[3:0] - rd_addr[3:0]
1	WR_FULL	WR_FULL	Indicates FIFO is full
0	RD_EMPTY	RD_EMPTY	Indicates FIFO is empty

A0120038 **FIFO_ADDR_CLR** **FIFO Address Clear Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FIFO_ADDR_CLR
Type																WO
Reset																0

Bit(s)	Mnemonic	Name	Description
0	FIFO_ADDR_CLR	FIFO_ADDR_CLR	When written with 1'b1, a 1 pulse fifo_addr_clr is generated to clear the FIFO address back to 0.

A0120040 **IO_CONFIG** **IO Config Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													IDLE_OE_EN		SDA_I2C_O_CONFIG	SCL_I2C_O_CONFIG
Type													RW		RW	RW
Reset													0		0	0

Overview: This register is used to configure the I/O for the SDA and SCL lines to select between normal I/O mode or open-drain mode to support wired-and bus.

Bit(s)	Mnemonic	Name	Description
3	IDLE_OE_EN	IDLE_OE_EN	0: Does not drive bus in idle state

Bit(s)	Mnemonic	Name	Description
N			1: Drive bus in idle state
1	SDA_IO_CONFIG_NFIG	SDA_IO_CONFIG	0: Normal tristate I/O mode 1: Open-drain mode
0	SCL_IO_CONFIG_NFIG	SCL_IO_CONFIG	0: Normal tristate I/O mode 1: Open-drain mode

A0120048 **HS** High Speed Mode Register 0102

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name		HS_SAMPLE_CNT_DIV				HS_STEP_CNT_DIV				MASTER_CODE					HS_NACK_ERR_DET_EN	HS_EN
Type		RW				RW				RW					RW	RW
Reset		0	0	0		0	0	1		0	0	0			1	0

Overview: This register contains options for supporting high speed operation features. Each HS half pulse width, i.e. each high or low pulse, is equal to $(\text{step_cnt_div} + 1) * (\text{sample_cnt_div} + 1) / 13\text{MHz}$.

Bit(s)	Mnemonic	Name	Description
14:12	HS_SAMPLE_CNT_DIV	HS_SAMPLE_CNT_DIV	When the high-speed mode is entered after the master code transfer is completed, the sample width will become dependent on this parameter.
10:8	HS_STEP_CNT_DIV	HS_STEP_CNT_DIV	When the high-speed mode is entered after the master code transfer is completed, the number of samples per half pulse width will become dependent on this value.
6:4	MASTER_CODE	MASTER_CODE	This is the 3 bit programmable value for the master code to be transmitted.
1	HS_NACK_ERR_DET_EN	HS_NACKERR_DET_EN	Enables NACKERR detection during the master code transmission When enabled, if NACK is not received after the master code is transmitted, the transaction will be terminated with a STOP condition.
0	HS_EN	HS_EN	Enables high-speed transaction <i>Note: rs_stop must be set to 1.</i>

A0120050 **SOFTRESET** Soft Reset Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SOFT_RESET
Type																WO
Reset																0

Bit(s)	Mnemonic	Name	Description
0	SOFT_RESET	SOFT_RESET	When written with 1'b1, a 1 pulse soft reset is used as synchronous reset to reset the I2C internal hardware circuits.

A0120060 **SPARE** SPARE 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset													0	0	0	0

Bit(s)	Mnemonic	Name	Description
3:0	SPARE	SPARE	Reserved for future use

A0120064 **DEBUGSTAT** Debug Status Register 0020

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									BUS_BUSY	MASTER_WRITE	MASTER_READ					
Type									RO	RO	RO					
Reset									0	0	1	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
7	BUS_BUSY	SPARE	Reserved
6	MASTER_WRITE	MASTER_WRITE	For debugging only 1: Current transfer is in the master write dir.
5	MASTER_READ	MASTER_READ	For debugging only 1: Current transfer is in the master read dir.
4:0	MASTER_STATE	MASTER_STATE	(For debugging only) Reads back the current master_state. 0: Idle state 1: I2C master is preparing to send out the start bit, SCL=1, SDA=1. 2: I2C master is sending out the start bit, SCL=1, SDA=0. 3: I2C master/slave is preparing to transmit data bit, SCL=0, SDA=data bit. (Data bit can be changed when SCL=0.) 4: I2C master/slave is transmitting data bit, SCL=1, SDA=data bit. (Data bit is stable when SCL=1.) 5: I2C master/slave is preparing to transmit the ACK bit, SCL=0, SDA=ack. (The ACK bit can be changed when SCL=0.) 6: I2C master/slave is transmitting the ACK bit, SCL=1, SDA=0. (The ACK bit is stable when SCL=1.) 7: I2C master is preparing to send out stop bit or repeated-start bit, SCL=0, SDA=0/1. (0: Stop bit; 1: Repeated-start bit) 8: I2C master is sending out stop bit or repeated-start bit, SCL=1, SDA=1/0. (0: Repeated-start bit; 1: Stop bit) 9: I2C master is in delay start between two transfers, SCL=1, SDA=1. 10: I2C master is in FIFO wait state; For writing transaction, it means FIFO is empty and I2C master is waiting for DMA controller to write data into FIFO. For reading transaction, it means FIFO is full and I2C master is waiting for DMA controller to read data from FIFO, SCL=0, SDA=don't care. 12: I2C master is preparing to send out data bit of master code. This state is used only in high-speed transaction, SCL=0, SDA=data bit of master code. (Data bit of master code can be changed when SCL=0.)

Bit(s)	Mnemonic	Name	Description
			13: I2C master is sending out data bit of master code. This state is used only in high-speed transaction, SCL=1, SDA=data bit of master code. (Data bit of master code is stable when SCL=1.)
			14: I2C master/slave is preparing to transmit the NACK bit, SCL=0, SDA=nack bit. (The NACK bit can be changed when SCL=0.) This state is used only in high-speed transaction.
			15: I2C master/slave is transmitting the NACK bit, SCL=1, SDA=1. This state is used only in high-speed transaction.

A0120068 **DEBUGCTRL** Debug Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															APB_DEBUG_RD	FIFO_APB_DEBUG
Type															WO	RW
Reset															0	0

Bit(s)	Mnemonic	Name	Description
1	APB_DEBUG_RD	APB_DEBUG_RD	Only valid when fifo_apb_debug is set to 1 Writing to this register will generate a 1 pulsed FIFO APB RD signal for reading the FIFO data.
0	FIFO_APB_DEBUG	FIFO_APB_DEBUG	Used for trace 32 debugging When using trace 32, and the memory map is shown, turning this bit on will block the normal APB read access. The APB read access to the FIFO will then be enabled by writing to apb_debug_rd. 0: Disable 1: Enable

A012006C **TRANSFER_LENGTH_AUX** Transfer Length Register (Number of Bytes per Transfer) 0001

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset													0	0	0	1

Bit(s)	Mnemonic	Name	Description
3:0	TRANSFER_LENGTH_AUX	TRANSFER_LENGTH_AUX	Only valid when dir_change or transfer_len_change is set to 1. Indicates the number of data bytes to be transferred in 1 transfer unit (excluding slave address byte) for the transfers following the direction change or transfer_len_change If dir_change =1, the first write transfer length will depend on transfer_len, while the second read transfer length will depend on transfer_len_aux. Dir change is always after the first transfer. Similarly, transfer length change is always after the first transfer. Note: The value must be set to be bigger than 1; otherwise no transfer will take place.

A0120074 **TIMEOUT** Timeout Timing Register FFFF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	TIMEOUT															
Type	RW															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit(s)	Mnemonic	Name	Description
15:0		TIMEOUT	Indicates the number of steps to count before time-out The time-out counter counts only when the time-out mechanism is enabled and has started a transaction.

3.11 I2C/SCCB Controller (I2C_SCCB_Controller_V18)

3.11.1 General Description

I2C (Inter-IC)/SCCB (Serial Camera Control Bus) is a two-wire serial interface. The two signals are SCL and SDA. SCL is a clock signal that is driven by the master. SDA is a bi-directional data signal that can be driven by either the master or the slave. This generic controller supports the master role and conforms to the I2C specification.

3.11.1.1 Feature

- I2C compliant master mode operation
- Adjustable clock speed for LS/FS mode operation
- Supports 7-bit/10-bit addressing
- Supports high-speed mode
- Supports slave clock extension
- START/STOP/REPEATED START condition
- Manual transfer mode
- Multi-write per transfer (up to 8 data bytes for non-DMA mode)
- Multi-read per transfer (up to 8 data bytes for non-DMA mode)
- Multi-transfer per transaction
- Combined format transfer with length change capability
- Active drive/wired-and I/O configuration

3.11.1.2 Manual Transfer Mode

The controller offers one transfer mode, the manual mode.

When the manual mode is selected, in addition to the slave address register, the controller has a built-in 8byte deep FIFO which allows MCU to prepare up to 8 bytes of data for a write transfer, or read up to 8 bytes of data for a read transfer.

3.11.1.3 Transfer Format Support

This controller has been designed to be as generic as possible in order to support a wide range of devices that may utilize different combinations of transfer formats. Here are the transfer format types that can be supported through different software configuration:

Wording convention note

- Transfer = Anything encapsulated within a Start and Stop or Repeated Start.
- Transfer length = Number of bytes within the transfer
- Transaction = This is the top unit. Everything combined equals 1 transaction.
- Transaction length = Number of transfers to be conducted.

 Master to slave dir

 Slave to master dir

Single-byte access

Single Byte Write

Single Byte Read

Multi-byte access

Multi Byte Write

Multi Byte Read

Multi-byte transfer + multi-transfer (same direction)

Multi Byte Write + Multi Transfer

Multi Byte Read + Multi Transfer

Multi-byte transfer + multi-transfer w RS (same direction)

Multi Byte Write + Multi Transfer + Repeated Start

Multi Byte Read + Multi Transfer + Repeated Start

Combined write/read with Repeated Start (direction change)

Note: Only supports write and then read sequence. Read and then write is not supported.

Combined Multi Byte Write + Multi Byte Read

3.11.2 Programming Examples

Common transfer programmable parameters

Programmable Parameters

Output waveform timing programmable parameters

3.11.3 Register Definition

Module name: I2C_SCCB_Controller_V18 base address: (+A02A0000h)

Address	Name	Width	Register function
A02A0000	DATA_PORT	16	Data port register
A02A0004	SLAVE_ADDR	16	Slave address register
A02A0008	INTR_MASK	16	Interrupt mask register This register provides masks for the corresponding interrupt sources as indicated in the intr_stat register. 1 = Allow interrupt 0 = Disable interrupt <i>Note: While disabled, the corresponding interrupt will not be asserted, however intr_stat will still be updated with the status, i.e. mask does not affect intr_stat register values.</i>
A02A000C	INTR_STAT	16	Interrupt status register When an interrupt is issued by the I2C controller, this register will need to be read by MCU to determine the cause for the interrupt. After this status has been read and appropriate actions are taken, the corresponding interrupt source will need to be written 1 to clear.
A02A0010	CONTROL	16	Control register

Address	Name	Width	Register function
A02A0014	TRANSFER_LEN	16	Transfer length register (number of bytes per transfer)
A02A0018	TRANSAC_LEN	16	Transaction length register (number of transfers per transaction)
A02A001C	DELAY_LEN	16	Inter delay length register
A02A0020	TIMING	16	Timing control register LS/FS only. This register is used to control the output waveform timing. Each half pulse width, i.e. each high or low pulse, is equal to $(\text{step_cnt_div}+1) \times (\text{sample_cnt_div} + 1) / 13\text{MHz}$
A02A0024	START	16	Start register
A02A0030	FIFO_STAT	16	FIFO status register
A02A0038	FIFO_ADDR_CLR	16	FIFO address clear register
A02A0040	IO_CONFIG	16	IO config register This register is used to configure the I/O for the SDA and SCL lines to select between normal I/O mode, or open-drain mode to support wired-and bus.
A02A0048	HS	16	High speed mode register This register contains options for supporting high speed operation features. Each HS half pulse width, i.e. each high or low pulse, is equal to $(\text{step_cnt_div}+1) \times (\text{sample_cnt_div} + 1) / 13\text{MHz}$
A02A0050	SOFTRESET	16	Soft reset register
A02A0060	SPARE	16	SPARE
A02A0064	DEBUGSTAT	16	Debug status register
A02A0068	DEBUGCTRL	16	Debug control register
A02A006C	TRANSFER_LEN_A UX	16	Transfer length register (number of bytes per transfer)
A02A0074	TIMEOUT	16	Timeout timing register

A02A0000 [DATA_PORT](#) Data Port Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DATA_PORT							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
7:0	DATA_PORT	DATA_PORT	FIFO access port During master write sequences ($\text{slave_addr}[0] = 0$), this port can be written by APB, and during master read sequences ($\text{slave_addr}[0] = 1$), this port can be read by APB. <i>Note: Slave_addr must be set correctly before accessing FIFO.</i>

Bit(s)	Mnemonic	Name	Description
			For debugging only: If the fifo_apb_debug bit is set, FIFO can be read and written by the APB.

A02A0004 **SLAVE_ADDR** Slave Address Register **00BF**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									1	0	1	1	1	1	1	1

Bit(s)	Mnemonic	Name	Description
7:0	SLAVE_ADDR	SLAVE_ADDR	Specifies the slave address of the device to be accessed Bit 0 is defined by the I2C protocol as a bit that indicates the direction of transfer. 0: Master write 1: Master read

A02A0008 **INTR_MASK** Interrupt Mask Register **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												MASK_TIMEOUT		MASK_HS_NACKERR	MASK_ACKERR	MASK_TRANSAC_COMP
Type												RW		RW	RW	RW
Reset												0		0	0	0

Overview: This register provides masks for the corresponding interrupt sources as indicated in the intr_stat register. 1 = allow interrupt; 0 = disable interrupt. Note that while disabled, the corresponding interrupt will not be asserted. However, intr_stat will still be updated with the status, i.e. mask does not affect intr_stat register values.

Bit(s)	Mnemonic	Name	Description
4	MASK_TIMEOUT	MASK_TIMEOUT	Setting this value to 0 will mask TIMEOUT interrupt signal.
2	MASK_HS_NACKERR	MASK_HS_NACKERR	Setting this value to 0 will mask HS_NACKERR interrupt signal.
1	MASK_ACKERR	MASK_ACKERR	Setting this value to 0 will mask ACK_ERR interrupt signal.
0	MASK_TRANSAC_COMP	MASK_TRANSAC_COMP	Setting this value to 0 will mask TRANSAC_COMP interrupt signal.

A02A000C **INTR_STAT** Interrupt Status Register **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												TIMEOUT	ARB_LOST	HS_NACKERR	ACKERR	TRANSAC_COMP
Type												W1C	W1C	W1C	W1C	W1C

Reset											0	0	0	0	0
-------	--	--	--	--	--	--	--	--	--	--	---	---	---	---	---

Overview: When an interrupt is issued by the I2C controller, this register will need to be read by MCU to determine the cause for the interrupt. After this status has been read and appropriate actions are taken, the corresponding interrupt source will need to be written 1 to clear.

Bit(s)	Mnemonic	Name	Description
4	TIMEOUT	TIMEOUT_IRQ	This status is asserted if time-out is enabled and the timer expires. The internal master state machine will stop, and MCU will need to manually clear the state machine by either issuing software reset by disabling the transact_en bit. Time-out can be used to detect PCB or I2C malfunction.
3	ARB_LOST	SPARE	Reserved
2	HS_NACKERR	HS_NACKERR	This status is asserted if HS master code NACK error detection is enabled. If enabled, HS master code NACK err will cause transaction to end, and stop will be issued.
1	ACKERR	ACKERR	This status is asserted if ACK error detection is enabled. If enabled, ACKERR will cause transaction to end, and stop will be issued.
0	TRANSAC_COMP	TRANSAC_COMP	This status is asserted when a transaction is completed successfully.

A02A0010 **CONTROL** Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name								TIMEOUT_EN	RESET_BUSY_EN	TRANSFER_LEN_CHANGE	ACKERR_DET_EN	DIR_CHANGE	CLK_EXTEN		RS_STOP	
Type								RW	RW	RW	RW	RW	RW		RW	
Reset								0	0	0	0	0	0		0	

Bit(s)	Mnemonic	Name	Description
8	TIMEOUT_EN	TIMEOUT_EN	Enables time-out mechanism When enabled, if SCL stays at 0 for too long period of time due to I2C slave holds SCL at 0 for too long or SCL sticks at 0 due to PCB issue, the master shall terminate the transaction, stop the internal state machine and assert time-out interrupt. MCU shall handle this case appropriately and reset the master and FIFO address before reissuing the transaction again. If this option is disabled, the HW timer will not count and nor expire forever. 0: Disable 1: Enable
7	RESET_BUSY_EN	SPARE	Reserved
6	TRANSFER_LEN_CHANGE	TRANSFER_LEN_CHANGE	Specifies whether or not to change the transfer length after the first transfer is completed If enabled, the transfers after the first transfer will use the transfer_len_aux parameter. 0: Disable 1: Enable
5	ACKERR_DET_EN	ACKERR_DET_EN	Enables slave ACK error detection When enabled, if slave ACK error is detected, the master shall

Bit(s)	Mnemonic	Name	Description
			terminate the transaction by issuing a STOP condition and then assert the ACKERR interrupt. MCU handles this case appropriately then resets the FIFO address before reissuing transaction. If this option is disabled, the controller will ignore slave ACK error and keep on scheduled transaction. 0: Disable 1: Enable
4	DIR_CHANG E	DIR_CHANGE	Combined transfer format, where the direction of transfer is to be changed from write to read after the FIRST RS condition <i>Note: When set to 1, the transfers after the direction change will be based on the transfer_len_aux parameter.</i> 0: Disable 1: Enable
3	CLK_EXT_E N	CLK_EXT_EN	I2C spec allows slaves to hold the SCL line low if it is not yet ready for further processing Therefore, if this bit is set to 1, the master controller will enter a high wait state until the slave releases the SCL line.
1	RS_STOP	RS_STOP	In LS/FS mode, this bit affects multi-transfer transaction only. It controls whether or not the REPEATED-START condition is used between transfers. The last ending transfer always ends with a STOP. In HS mode, this bit must be set to 1. 0: Use STOP 1: Use REPEATED-START

A02A0014 TRANSFER_LEN Transfer Length Register (Number of Bytes per Transfer) **0001**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													TRANSFER_LEN_AUX			
Type													RW			
Reset													0	0	0	1

Bit(s)	Mnemonic	Name	Description
3:0	TRANSFER_LEN_AUX	TRANSFER_LEN	Indicates the number of data bytes to be transferred in 1 transfer unit (excluding slave address byte) <i>Note: The value must be set to be bigger than 1; otherwise no transfer will take place.</i>

A02A0018 TRANSAC_LEN Transaction Length Register (Number of Transfers per Transaction) **0001**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									TRANSAC_LEN							
Type									RW							
Reset									0	0	0	0	0	0	0	1

Bit(s)	Mnemonic	Name	Description
7:0	TRANSAC_LEN	TRANSAC_LEN	Indicates the number of transfers to be transferred in 1 transaction <i>Note: The value must be set to be bigger than 1; otherwise no</i>

Bit(s)	Mnemonic	Name	Description
			transfer will take place.

A02A001C **DELAY_LEN** Inter Delay Length Register **0002**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DELAY_LEN							
Type									RW							
Reset									0	0	0	0	0	0	1	0

Bit(s)	Mnemonic	Name	Description
7:0	DELAY_LEN	DELAY_LEN	Sets up wait delay between consecutive transfers when RS_STOP bit is set to 0 Unit: Half the pulse width

A02A0020 **TIMING** Timing Control Register **1303**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DATA_READ_ADJ	DATA_READ_TIME				SAMPLE_CNT_DIV				STEP_CNT_DIV						
Type	RW	RW				RW				RW						
Reset	0	0	0	1		0	1	1			0	0	0	0	1	1

Overview: LS/FS only. This register is used to control the output waveform timing. Each half pulse width, i.e. each high or low pulse, is equal to (step_cnt_div+1)*(sample_cnt_div + 1)/13MHz

Bit(s)	Mnemonic	Name	Description
15	DATA_READ_ADJ	DATA_READ_ADJ	When set to 1, data latch in sampling time during master reads are adjusted according to the DATA_READ_TIME value. Otherwise, by default, the data are latched in at half of the high pulse width point. This value must be set to be smaller than or equal to half the high pulse width.
14:12	DATA_READ_TIME	DATA_READ_TIME	This value is valid only when DATA_READ_ADJ is set to 1. This can be used to adjust so that the data are latched in at earlier sampling points (assuming data are settled by then).
10:8	SAMPLE_CNT_DIV	SAMPLE_CNT_DIV	Used for LS/FS only. This adjusts the width of each sample. Sample width = (sample_cnt_div + 1)/13MHz
5:0	STEP_CNT_DIV	STEP_CNT_DIV	Specifies the number of samples per half pulse width, i.e. each high or low pulse

A02A0024 **START** Start Register **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																START
Type																RW
Reset																0

Bit(s)	Mnemonic	Name	Description
0	START	START	Starts the transaction on the bus It is auto de-asserted at the end of the transaction.

A02A0030 **FIFO_STAT** **FIFO Status Register** **0001**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	RD_ADDR				WR_ADDR				FIFO_OFFSET						WR_FULL	RD_EMPTY
Type	RO				RU				RU						RO	RO
Reset	0	0	0	0	0	0	0	0	0	0	0	0			0	1

Bit(s)	Mnemonic	Name	Description
15:12	RD_ADDR	RD_ADDR	Current RD address pointer Only bit [2:0] have physical meanings.
11:8	WR_ADDR	WR_ADDR	Current WR address pointer Only bit [2:0] have physical meanings.
7:4	FIFO_OFFSET	FIFO_OFFSET	wr_addr[3:0] - rd_addr[3:0]
1	WR_FULL	WR_FULL	Indicates FIFO is full
0	RD_EMPTY	RD_EMPTY	Indicates FIFO is empty

A02A0038 **FIFO_ADDR_CLR** **FIFO Address Clear Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FIFO_ADDR_CLR
Type																WO
Reset																0

Bit(s)	Mnemonic	Name	Description
0	FIFO_ADDR_CLR	FIFO_ADDR_CLR	When written with 1'b1, a 1 pulse fifo_addr_clr is generated to clear the FIFO address back to 0.

A02A0040 **IO_CONFIG** **IO Config Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													IDLE_OE_EN		SDA_I2C_O_CONFIG	SCL_I2C_O_CONFIG
Type													RW		RW	RW
Reset													0		0	0

Overview: This register is used to configure the I/O for the SDA and SCL lines to select between normal I/O mode or open-drain mode to support wired-and bus.

Bit(s)	Mnemonic	Name	Description
3	IDLE_OE_EN	IDLE_OE_EN	0: Does not drive bus in idle state

Bit(s)	Mnemonic	Name	Description
N			1: Drive bus in idle state
1	SDA_IO_CONFIG	SDA_IO_CONFIG	0: Normal 1: Open-drain mode
0	SCL_IO_CONFIG	SCL_IO_CONFIG	0: Normal 1: Open-drain mode

A02A0048 **HS** High Speed Mode Register 0102

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name		HS_SAMPLE_CNT_DIV				HS_STEP_CNT_DIV				MASTER_CODE					HS_NACK_ERR_DET_EN	HS_EN
Type		RW				RW				RW					RW	RW
Reset		0	0	0		0	0	1		0	0	0			1	0

Overview: This register contains options for supporting high speed operation features. Each HS half pulse width, i.e. each high or low pulse, is equal to $(\text{step_cnt_div}+1) \times (\text{sample_cnt_div} + 1) / 13\text{MHz}$.

Bit(s)	Mnemonic	Name	Description
14:12	HS_SAMPLE_CNT_DIV	HS_SAMPLE_CNT_DIV	When the high-speed mode is entered after the master code transfer is completed, the sample width will become dependent on this parameter.
10:8	HS_STEP_CNT_DIV	HS_STEP_CNT_DIV	When the high-speed mode is entered after the master code transfer is completed, the number of samples per half pulse width will become dependent on this value.
6:4	MASTER_CODE	MASTER_CODE	This is the 3 bit programmable value for the master code to be transmitted.
1	HS_NACK_ERR_DET_EN	HS_NACKERR_DET_EN	Enables NACKERR detection during the master code transmission When enabled, if NACK is not received after the master code is transmitted, the transaction will be terminated with a STOP condition.
0	HS_EN	HS_EN	Enables high-speed transaction <i>Note: rs_stop must be set to 1.</i>

A02A0050 **SOFTRESET** Soft Reset Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SOFT_RESET
Type																WO
Reset																0

Bit(s)	Mnemonic	Name	Description
0	SOFT_RESET	SOFT_RESET	When written with 1'b1, a 1 pulse soft reset is used as synchronous reset to reset the I2C internal hardware circuits.

A02A0060 **SPARE** SPARE 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset													0	0	0	0

Bit(s)	Mnemonic	Name	Description
3:0	SPARE	SPARE	Reserved for future use

A02A0064 **DEBUGSTAT** Debug Status Register 0020

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									BUS_BUSY	MASTER_WRITE	MASTER_READ					
Type									RO	RO	RO					
Reset									0	0	1	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
7	BUS_BUSY	SPARE	Reserved
6	MASTER_WRITE	MASTER_WRITE	For debugging only 1: Current transfer is in the master write dir.
5	MASTER_READ	MASTER_READ	For debugging only 1: Current transfer is in the master read dir.
4:0	MASTER_STATE	MASTER_STATE	(For debugging only) Reads back the current master_state. 0: Idle state 1: I2C master is preparing to send out the start bit, SCL=1, SDA=1. 2: I2C master is sending out the start bit, SCL=1, SDA=0. 3: I2C master/slave is preparing to transmit data bit, SCL=0, SDA=data bit. (Data bit can be changed when SCL=0.) 4: I2C master/slave is transmitting data bit, SCL=1, SDA=data bit. (Data bit is stable when SCL=1.) 5: I2C master/slave is preparing to transmit the ACK bit, SCL=0, SDA=ack. (The ACK bit can be changed when SCL=0.) 6: I2C master/slave is transmitting the ACK bit, SCL=1, SDA=0. (The ACK bit is stable when SCL=1.) 7: I2C master is preparing to send out stop bit or repeated-start bit, SCL=0, SDA=0/1. (0: Stop bit; 1: Repeated-start bit) 8: I2C master is sending out stop bit or repeated-start bit, SCL=1, SDA=1/0. (0: Repeated-start bit; 1: Stop bit) 9: I2C master is in delay start between two transfers, SCL=1, SDA=1. 10: I2C master is in FIFO wait state; For writing transaction, it means FIFO is empty and I2C master is waiting for DMA controller to write data into FIFO. For reading transaction, it means FIFO is full and I2C master is waiting for DMA controller to read data from FIFO, SCL=0, SDA=don't care. 12: I2C master is preparing to send out data bit of master code. This state is used only in high-speed transaction, SCL=0, SDA=data bit of master code. (Data bit of master code can be changed when SCL=0.)

Bit(s)	Mnemonic	Name	Description
			13: I2C master is sending out data bit of master code. This state is used only in high-speed transaction, SCL=1, SDA=data bit of master code. (Data bit of master code is stable when SCL=1.)
			14: I2C master/slave is preparing to transmit the NACK bit, SCL=0, SDA=nack bit. (The NACK bit can be changed when SCL=0.) This state is used only in high-speed transaction.
			15: I2C master/slave is transmitting the NACK bit, SCL=1, SDA=1. This state is used only in high-speed transaction.

A02A0068 **DEBUGCTRL** Debug Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															APB_DEBUG_RD	FIFO_APB_DEBUG
Type															WO	RW
Reset															0	0

Bit(s)	Mnemonic	Name	Description
1	APB_DEBUG_RD	APB_DEBUG_RD	Only valid when fifo_apb_debug is set to 1 Writing to this register will generate a 1 pulsed FIFO APB RD signal for reading the FIFO data.
0	FIFO_APB_DEBUG	FIFO_APB_DEBUG	Used for trace 32 debugging When using trace 32, and the memory map is shown, turning this bit on will block the normal APB read access. The APB read access to the FIFO will then be enabled by writing to apb_debug_rd. 0: Disable 1: Enable

A02A006C **TRANSFER_LEN_AUX** Transfer Length Register (Number of Bytes per Transfer) 0001

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset													0	0	0	1

Bit(s)	Mnemonic	Name	Description
3:0	TRANSFER_LEN_AUX	TRANSFER_LEN_AUX	Only valid when dir_change or transfer_len_change is set to 1. Indicates the number of data bytes to be transferred in 1 transfer unit (excluding slave address byte) for the transfers following the direction change or transfer_len_change If dir_change =1, the first write transfer length will depend on transfer_len, while the second read transfer length will depend on transfer_len_aux. Dir change is always after the first transfer. Similarly, transfer length change is always after the first transfer. Note: The value must be set to be bigger than 1; otherwise no transfer will take place.

A02A0074 **TIMEOUT** Timeout Timing Register FFFF

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	TIMEOUT															
Type	RW															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit(s)	Mnemonic	Name	Description
15:0		TIMEOUT	Indicates the number of steps to count before time-out The time-out counter counts only when the time-out mechanism is enabled and has started a transaction.

3.12 Real Time Clock

3.12.1 General Descriptions

The Real-Time Clock (RTC) module provides time and data information, as well as 32.768kHz clock. By configuring pin XOSC32_ENB, the use of the 32k crystal can be determined, i.e. using a 32k crystal, or not to use a 32k crystal. The RTC block has an independent power supply. When the mobile handset is powered off, a dedicated regulator supplies the RTC block. If the main battery is not present, a backup supply such as a small mercury cell battery or a large capacitor is used. In addition to providing timing data, an alarm interrupt is generated and can be used to power up the baseband core. Regulator interrupts corresponding to seconds, minutes, hours and days can be generated whenever the time counter value reaches a maximum value (e.g., 59 for seconds and minutes, 23 for hours, etc.). The year span is supported up to 2127. The maximum day-of-month values, which depend on the leap year condition, are stored in the RTC block.

3.12.2 Register Definition

Module name: RTC Base address: (+A0710000h)

Address	Name	Width	Register function
A0710000	RTC_BBPU	16	Baseband power up
A071 0004	RTC_IRQ_STA	16	RTC IRQ status This register is fixed to 0 when RTC_POWERKEY1 & RTC_POWERKEY2 unmatch the correct values.
A071 0008	RTC_IRQ_EN	16	RTC IRQ enable This register is fixed to 0 when RTC_POWERKEY1 & RTC_POWERKEY2 unmatch the correct values.
A071 000C	RTC_CII_EN	16	Counter increment IRQ enable This register activates or de-activates the IRQ generation when the TC counter reaches its maximum value.
A071 0010	RTC_AL_MAS K	16	RTC alarm mask The alarm condition for alarm IRQ generation depends on whether or not the corresponding bit in this register is masked. Warning: If you set all bits to 1 in

Address	Name	Width	Register function
			RTC_AL_MASK (i.e. RTC_AL_MASK=0x7f) and PWREN=1 in RTC_BBPU, it means the alarm will come every second, not disabled.
A071 0014	<u>RTC_TC_SEC</u>	16	RTC seconds time counter register
A071 0018	<u>RTC_TC_MIN</u>	16	RTC minutes time counter register
A071001C	<u>RTC_TC_HOU</u>	16	RTC hours time counter register
A0710020	<u>RTC_TC_DOM</u>	16	RTC day-of-month time counter register
A0710024	<u>RTC_TC_DOW</u>	16	RTC day-of-week time counter register
A0710028	<u>RTC_TC_MTH</u>	16	RTC month time counter register
A071002C	<u>RTC_TC_YEA</u>	16	RTC year time counter register
A0710030	<u>RTC_AL_SEC</u>	16	RTC second alarm setting register
A0710034	<u>RTC_AL_MIN</u>	16	RTC minute alarm setting register
A0710038	<u>RTC_AL_HOU</u>	16	RTC hour alarm setting register
A071003C	<u>RTC_AL_DOM</u>	16	RTC day-of-month alarm setting register
A0710040	<u>RTC_AL_DOW</u>	16	RTC day-of-week alarm setting register
A0710044	<u>RTC_AL_MTH</u>	16	RTC month alarm setting register
A0710048	<u>RTC_AL_YEA</u>	16	RTC year alarm setting register
A071004C	<u>RTC_OSC32C ON</u>	16	OSC32 control The function is only active when RTC_POWERKEY1 & RTC_POWERKEY2 match the correct values.
A0710050	<u>RTC_POWERK EY1</u>	16	RTC_POWERKEY1 register
A0710054	<u>RTC_POWERK EY2</u>	16	RTC_POWERKEY2 register
A0710058	<u>RTC_PDN1</u>	16	PDN1
A071005C	<u>RTC_PDN2</u>	16	PDN2
A0710060	<u>RTC_SPAR0</u>	16	Spare register for specific purpose
A0710064	<u>RTC_SPAR1</u>	16	Spare register for specific purpose
A0710068	<u>RTC_PROT</u>	16	Lock/unlock scheme to prevent RTC miswriting
A071006C	<u>RTC_DIFF</u>	16	One-time calibration offset This register is fixed to 0 when RTC_POWERKEY1 & RTC_POWERKEY2 unmatch the correct values.
A0710070	<u>RTC_CALI</u>	16	Repeat calibration offset This register is fixed to 0 when RTC_POWERKEY1 & RTC_POWERKEY2 unmatch the correct values.
A0710074	<u>RTC_WRTGR</u>	16	Enable transfers from core to RTC in queue
A0710078	<u>RTC_CON</u>	16	Other RTC control registers Note: LPRST and LPEN are tied to 0 internally when RTC_POWERKEY1 & RTC_POWERKEY2 do not match the correct values. After changing RTC_CON, write WRTGR = 1 to make it take effect.

A0710000 RTC BBPU Baseband Power Up

0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne	KEY_BBPU									CBUSY	RELOAD	CLRPKY	AUTO	BBPU		PWREN
Type	WO									RO	WO	WO	RW	RW		RW
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0		0

Bit (s)	Mnemonic	Name	Description
15:8	KEY_BBPU	KEY_BBPU	A bus write is acceptable only when KEY_BBPU=0x43.
6	CBUSY	CBUSY	The read/write channels between RTC/Core is busy. This bit indicates high after the software program sequence to anyone of RTC data registers and enables the transfer by RTC_WRTGR = 1. In addition, it is high after the reset from low to high due to RTC reload process.
5	RELOAD	RELOAD	Reloads the values from RTC domain to core domain Generally the RTC will reload and synchronize the data from RTC to core when being reset from 0 to 1. This bit can be treated as a debugging bit.
4	CLRPKY	CLRPKY	Clears powerkey1 and powerkey2 at the same time In some cases, the software may clear powerkey1 & powerkey2. BBWAKEUP depends on the matching specific patterns of powerkey1 and powerkey2. If any one of powerkey1 or powerkey2 or BBPU is cleared, BBWAKEUP will go low immediately. The software cannot program the other control bits without power. By programming RTC_BBPU with CLRPKY = 1 and BBPU = 0 condition, RTC can clear powerkey1, powerkey2 and BBPU at the same time.
3	AUTO	AUTO	Controls if BBWAKEUP is automatically in the low state when SYSRST transitions from high to low. 0: BBWAKEUP is not automatically in the low state when SYSRST# transitions are from high to low. 1: BBWAKEUP is automatically in the low state when SYSRST# transitions are from high to low. The function is only active when RTC_POWERKEY1 & RTC_POWERKEY2 match the correct values.
2	BBPU	BBPU	Controls the power of PMU If powerkey1 = A357h and powerkey2 = 67D2h, PMU takes on the value programmed by software; otherwise PMU is low. 0: Power down 1: Power on
0	PWREN	PWREN	0: RTC alarm has no action on power switch. 1: When an RTC alarm occurs, BBPU is set to 1 and the system is powered on by RTC alarm wakeup.

A0710004 RTC IRQ STA RTC IRQ Status

0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne													LPSTA		TCSSTA	ALSTA
Type													RC		RC	RC
Reset													0		0	0

Overview: This register is read-cleared and is fixed to 0 when RTC_POWERKEY1 and RTC_POWERKEY2 unmatch the correct values.

Bit (s)	Mnemonic	Name	Description
3	LPSTA	LPSTA	Indicates the IRQ status and whether or not the LPD is asserted (LPD function is either provided by XOSC32 or EOSC32 ⁶ , depending on XOSC32_ENB) 0: No IRQ occurred; the 32K clock is good. 1: IRQ occurred; the 32K clock stops. This can be masked by LP_EN or cleared by initializing LPD.
1	TCSTA	TCSTA	Indicates the IRQ status and whether or not the tick condition has been met. 0: No IRQ occurred; the tick condition has not been met. 1: IRQ occurred; the tick condition has been met.
0	ALSTA	ALSTA	Indicates the IRQ status and whether or not the alarm condition has been met. 0: No IRQ occurred; the alarm condition has not been met. 1: IRQ occurred; the alarm condition has been met.

A0710008	RTC_IRQ_EN				RTC IRQ Enable								0000			
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne													LP_EN	ONESHOT	TC_EN	AL_EN
Type													RW	RW	RW	RW
Reset													0	0	0	0

Overview: This register is fixed to 0 when RTC_POWERKEY1 and RTC_POWERKEY2 unmatch the correct values.

Bit (s)	Mnemonic	Name	Description
3	LP_EN	LP_EN	Enables the control bit for IRQ generation if low power detected (32k clock off). 0: Disable IRQ generations 1: Enable LPD
2	ONESHOT	ONESHOT	Controls automatic reset of AL_EN and TC_EN
1	TC_EN	TC_EN	Enables the control bit for IRQ generation if the tick condition has been met. 0: Disable IRQ generations 1: Enable the tick time match interrupt. Clear the interrupt when ONESHOT is high upon generation of the corresponding IRQ.
0	AL_EN	AL_EN	Enables the control bit for IRQ generation if the alarm condition has been met. 0: Disable IRQ generations

Bit (s)	Mnemonic	Name	Description
			1: Enable the alarm time match interrupt. Clear the interrupt when ONESHOT is high upon generation of the corresponding IRQ.

A071000C **RTC_CII_EN** Counter Increment IRQ Enable **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne							1/8SECCII	1/4SECCII	1/2SECCII	YEACII	MTHCII	DOWCII	DOMCII	HOUCII	MINCII	SECCII
Type							RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Reset							0	0	0	0	0	0	0	0	0	0

Overview: This register activates or de-activates the IRQ generation when the TC counter reaches its maximum value.

Bit (s)	Mnemonic	Name	Description
9	1/8SECCII	SECCII_1_8	Set the bit to 1 to activate the IRQ at each 1/8 of a second update
8	1/4SECCII	SECCII_1_4	Set the bit to 1 to activate the IRQ at each 1/4 of a second update
7	1/2SECCII	SECCII_1_2	Set the bit to 1 to activate the IRQ at each 1/2 of a second update
6	YEACII	YEACII	Set the bit to 1 to activate the IRQ at each year update
5	MTHCII	MTHCII	Set the bit to 1 to activate the IRQ at each month update
4	DOWCII	DOWCII	Set the bit to 1 to activate the IRQ at each day-of-week update
3	DOMCII	DOMCII	Set the bit to 1 to activate the IRQ at each day-of-month update
2	HOUCII	HOUCII	Set the bit to 1 to activate the IRQ at each hour update
1	MINCII	MINCII	Set the bit to 1 to activate the IRQ at each minute update
0	SECCII	SECCII	Set this bit to 1 to activate the IRQ at each second update

A0710010 **RTC_AL_MASK** RTC Alarm Mask **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne										YEA_MSK	MTH_MSK	DOW_MSK	DOM_MSK	HOU_MSK	MIN_MSK	SEC_MSK
Type										RW	RW	RW	RW	RW	RW	RW
Reset										0	0	0	0	0	0	0

Overview: The alarm condition for alarm IRQ generation depends on whether or not the corresponding bit in this register is masked. Note that if all bits 1 in RTC_AL_MASK are set (i.e. RTC_AL_MASK = 0x7f) and PWREN = 1 in RTC_BBPU, it means the alarm will come every second, not disabled.

Bit (s)	Mnemonic	Name	Description
6	YEA_MSK	YEA_MSK	0: Condition (RTC_TC_YEA = RTC_AL_YEA) is checked to generate the alarm signal.

Bit (s)	Mnemonic	Name	Description
			1: Condition (RTC_TC_YEA = RTC_AL_YEA) is masked, i.e. the value of RTC_TC_YEA does not affect the alarm IRQ generation.
5	MTH_MSK	MTH_MSK	0: Condition (RTC_TC_MTH = RTC_AL_MTH) is checked to generate the alarm signal. 1: Condition (RTC_TC_MTH = RTC_AL_MTH) is masked, i.e. the value of RTC_TC_MTH does not affect the alarm IRQ generation.
4	DOW_MSK	DOW_MSK	0: Condition (RTC_TC_DOW = RTC_AL_DOW) is checked to generate the alarm signal. 1: Condition (RTC_TC_DOW = RTC_AL_DOW) is masked, i.e. the value of RTC_TC_DOW does not affect the alarm IRQ generation.
3	DOM_MSK	DOM_MSK	0: Condition (RTC_TC_DOM = RTC_AL_DOM) is checked to generate the alarm signal. 1: Condition (RTC_TC_DOM = RTC_AL_DOM) is masked, i.e. the value of RTC_TC_DOM does not affect the alarm IRQ generation.
2	HOU_MSK	HOU_MSK	0: Condition (RTC_TC_HOU = RTC_AL_HOU) is checked to generate the alarm signal. 1: Condition (RTC_TC_HOU = RTC_AL_HOU) is masked, i.e. the value of RTC_TC_HOU does not affect the alarm IRQ generation.
1	MIN_MSK	MIN_MSK	0: Condition (RTC_TC_MIN = RTC_AL_MIN) is checked to generate the alarm signal. 1: Condition (RTC_TC_MIN = RTC_AL_MIN) is masked, i.e. the value of RTC_TC_MIN does not affect the alarm IRQ generation.
0	SEC_MSK	SEC_MSK	0: Condition (RTC_TC_SEC = RTC_AL_SEC) is checked to generate the alarm signal. 1: Condition (RTC_TC_SEC = RTC_AL_SEC) is masked, i.e. the value of RTC_TC_SEC does not affect the alarm IRQ generation.

A071002C	<u>RTC TC YEA</u>	RTC Year Time Counter Register	0000
-----------------	--------------------------	---------------------------------------	-------------

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne										TC_YEAR						
Type										RW						
Reset										0	0	0	0	0	0	0

Bit (s)	Mnemonic	Name	Description
6:0	TC_YEAR	TC_YEAR	Year initial value for the time counter Range: 0 ~ 127 (2000-2127). The software can bias the year as multiples of 4 for the internal leap-year formula. Here are 3 examples: 2000 ~ 2127, 1972 ~ 2099 and 1904 ~ 2031. To simplify the process, the RTC hardware treats all 4-multiple as leap years. If the range you define includes non-leap 4-multiple year (e.g. 2100), please adjust it to the correct date by yourselves. (e.g. change Feb. 29th, 2100 to Mar. 1st, 2100). It is suggested to bias the range to be bigger than 1900 and smaller than 2100 to evade the manual adjustment, i.e. the bias values are suggested to be in the range of [-28,-96], that are (1972~ 2099) ~ (1904~ 2031). The formal leap formula: <pre> If year modulo 400 is 0 then leap Else if year modulo 100 is 0 then no_leap Else if year modulo 4 is 0 then leap Else no_leap </pre>

Reset	-	0	0	0	0	1	0	0	0	0	-	0	1	1	1	1

Overview: The function is only active when RTC_POWERKEY1 & RTC_POWERKEY2 match the correct values.

Bit (s)	Mnemonic	Name	Description
15:9	OSC32_RSV	OSC32_RSV	OSC32 reserved bits Keep it at 0x2.
8:6	EMB_MODE	EMBCK_SEL	Mode setting for crystal removal case

Bit (s)	Mnemonic	Name	Description
5	XOSC32_ENB	XOSC32_ENB	XOSC32_ENB Reads pin XOSC32_ENB configuration to know the 32k crystal usage. 0: Use 32k crystal 1: Does not use 32k crystal.
4:0	XOSCCALI	XOSCCALI	Controls XOSC32/EOSC32 calibration If XOSC32_ENB(RTC_OSC32CON[5]) = 0, XOSCCALI controls the bias current for 32k xtal in XOSC32. When powerkeys do not match, the default value is 0x7. If XOSC32_ENB(RTC_OSC32CON[5]) = 1, XOSCCALI is the trimming value for EOSC32. SW needs to find the best trimming value for EOSC32 when the 1 st power-on by frequency meter. When powerkeys do not match, the default value is 0xf.

OSC32CON is not protected by RTC_PROT because RTC_PROT needs 32.768kHz clock to unlock. Similarly, to modify RTC_OSC32CON, writing RTC_WRTGR is not needed, neither. To protect the OSC32 control bits, follow the *update sequence* to update RTC_OSC32CON. After the updating sequence is completed, reload to acquire the internal RTC_OSC32CON. This register needs to be initialized **before** writing powerkeys match.

Update sequence:

- Step 1: Write RTC_OSC32CON = 0x1a57 and wait until CBUSY=0
- Step 2: Write RTC_OSC32CON = 0x2b68 and wait until CBUSY=0
- Step 3: Write the real value you would like to write RTC_OSC32CON and wait until CBUSY=0
- Step 4: Return to step 1 if you need to modify RTC_OSC32CON again.

Note: RTC_OSC32CON should be set before writing POWERKEY1 and POWERKEY2 to the correct value.

These register sets are used to determine if the real-time clock has been programmed by the software, i.e. the time value in real time clock is correct. When the real-time clock is first powered on, the register contents are all undefined, and therefore the time values shown are incorrect. The software needs to know if the real-time clock has been programmed. Hence, the two registers are defined to solve this power-on issue. After the software programs the correct value, the two register sets will not need to be updated. In addition to programming the correct time value, when the contents of the register sets are wrong, the interrupt will not be generated. Therefore, the real time clock will not generate the interrupts before the software programs the registers, and unwanted interrupt due to wrong time value will not occur. The correct values of these two register sets are:

RTC_POWERKEY1 A357h
RTC_POWERKEY2 67D2h

Bit (s)	Mnemonic	Name	Description
---------	----------	------	-------------

			Protects RTC write interface by RTC_PROT
			Whether the RTC writing interface is enabled or not is decided by RTC_PROT contents. When RTC_POWERKEY1 & RTC_POWERKEY2 are not equal to the correct values, the RTC writing interface will always be enabled. However, when they match, the user has to perform the unlock flow to enable the writing interface.
			Unlock flow :
15:0	RTC_PROT	RTC_PROT	Step1: *RTC_PROT=0x586a;
			Step2: *RTC_WRTGR=1;
			Step3: while(*RTC_BBPU & 0x40) {}; // Timeout period: 120usec
			Step4: *RTC_PROT=0x9136;
			Step5: *RTC_WRTGR=1;
			Step6: while(*RTC_BBPU & 0x40) {}; // Timeout period: 120usec
			<i>Note: Always keep RTC in the unlock state in the power-on mode. Once the normal RTC content writing is completed, DO NOT modify the RTC_PROT content to lock RTC. The RTC_PROT contents will be cleared automatically when being powered off immediately.</i>

A071006C RTC_DIFF One-time Calibration Offset 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne	RESE RVED	RESE RVED			RTC_DIFF											
Type	RW	RO			RW											
Reset	-	-			0	0	0	0	0	0	0	0	0	0	0	0

Overview: This register is fixed to 0 when RTC_POWERKEY1 and RTC_POWERKEY2 unmatch the correct values.

Bit (s)	Mnemonic	Name	Description
11:0	RTC_DIFF	RTC_DIFF	Adjusts internal counter of RTC It takes effect once and returns to 0 when done. In some cases, RTC is faster or slower than the standard. To change RTC_TC_SEC being coarse may cause alarm problem. RTC_DIFF provides a finer time unit. An internal 15-bit counter accumulates in each 32,768Hz clock. Entering a non-0 value to RTC_DIFF will cause the internal RTC counter to increase or decrease RTC_DIFF when RTC_DIFF changes to 0 again. RTC_DIFF represents 2's complement. For example, if you fill in 0xff into RTC_DIFF, the internal counter will decrease by 1 when RTC_DIFF returns to 0. In other words, you can only use RTC_DIFF continuously if RTC_DIFF is equal to 0 now. Note: RTC_DIFF ranges from 0x800 (-2048) to 0x7fd (2045). 0x7ff & 0x7fe are forbidden.

A0710070 RTC_CALI Repeat Calibration Offset 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne	RESE RVED	RESE RVED			RTC_CALI											
Type	RO	RW			RW											
Reset	0	-	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: This register is fixed to 0 when RTC_POWERKEY1 & RTC_POWERKEY 2 unmatch the correct values.

Bit (s)	Mnemonic	Name	Description
13:0	RTC_CALI	RTC_CALI	Provides a repeated calibration scheme RTC_CALI provides 7-bit calibration capability in 8-second duration, i.e. 5-bit calibration capability in each second. RTC_CALI represents 2's complement form for the user to adjust RTC increase or decrease. Due to RTC_CALI is revealed in 8 seconds, the resolution is less than a 1/32768 clock. Avg. resolution: 1/32768/8 = 3.81us. Avg. adjust range: -0.244~0.240ms/sec in 2's complement: -0x2000 ~ 0x1fff (-8192 ~ 8191)

A0710074 RTC_WRTGR Enable Transfers From Core to RTC in Queue 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne																WRTGR
Type																WO
Reset																0

Bit (s)	Mnemonic	Name	Description
0	WRTGR	WRTGR	Enables the transfers from core to RTC After you modify all the RTC registers and would like to change it, write 1 to RTC_WRTGR to trigger the transfer. The prior writing operation is queued in the core power domain. The pending data will not be transferred to the RTC domain until WRTGR = 1. After WRTGR=1, the pending data will be transferred to the RTC domain sequentially in order of register addresses, from low to high. For example: RTC_BBPU -> RTC_IRQ_EN -> RTC_CII_EN -> RTC_AL_MASK -> RTC_TC_SEC -> etc. CBUSY in RTC_BBPU is equal to 1 in the writing process. Observe CBUSY to determine when the transmission is completed.

A0710078 RTC_CON Other RTC Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Mne	LPSTA_RAW	RESE RVED	RESE RVED	POWER OFF_SE Q_EN	RESE RVED	RESE RVED	RESE RVED	RESE RVED	RESE RVED	RESE RVED	RESE RVED	RESE RVED	LPRST	LPEN		VBAT_LPSTA_RAW
Type	W1 C	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW		RW
Reset																

Bit (s)	Mnemonic	Name	Description
15	LPSTA_RAW	LPSTA_RAW	Raw status of LP_STA Re-initialize LPD to clear this bit. <i>Note: This bit is always high before LPD initialization sequence after the first power-on.</i>
3	LPRST	LPRST	Resets LPDET B Only takes effect when LPEN = 1.
2:1	LPEN	LPEN	Enables LPDET B LP initialization sequence: - Write LPEN = 1, LPRST = 0. Write RTC_WRTGR = 1. wait cbusy down. - Write LPEN = 1, LPRST = 1. Write RTC_WRTGR = 1. wait cbusy down. - Write LPEN = 1, LPRST = 0. Write RTC_WRTGR = 1. wait cbusy down.
0	VBAT_LPSTA_RAW	VBAT_LPSTA_RAW	Indicates the battery has been in LP state Software needs to clear this bit for the next time use 0: VBAT has not been in LP state. 1: VBAT has been in LP state. <i>Note: VBAT LP state = VBAT < 2.5V</i>

When Vcore always exists, the software can trust the registers and wait for the LP interrupt from RTC if the 32.768 kHz clock stopped or has been stopped.

However, nothing can be trusted after the battery is off (Vrtc may drop). In every boot time, the software checks if $LPSTA_RAW = 1$. ($LP_STA = LPSTA_RAW \& LP_IRQ_EN$) If true, the RTC contents will no longer be trusted just like powerkeys do not match. You have to initialize the RTC contents in this case.

3.13 Auxiliary ADC Unit

The auxiliary ADC unit is used to monitor the status of the battery and charger, to identify the plugged peripheral, and to perform temperature measurement.

Figure 38. AUXADC architecture

Each channel operates in one of the two modes: immediate mode or timer-triggered mode. The mode of each channel can be individually selected through register AUXADC_CON0. For example, if the flag SYN0 in register AUXADC_CON0 is set, channel 0 will be set in the timer-triggered mode. Otherwise, the channel will operate in the immediate mode.

In the immediate mode, the A/D converter samples the value once only when the flag in the AUXADC_CON1 register is set. For example, if the flag IMM0 in AUXADC_CON1 is set, the A/D converter will sample the data for channel 0. The IMM flags must be cleared and set again to initialize another sampling.

The value sampled for channel 0 is stored in register AUXADC_DAT0, and the value for channel 1 is stored in register AUXADC_DAT1, and so on.

If the AUTOSSET flag in register AUXADC_CON3 is set, the auto-sample function will be enabled. The A/D converter samples the data for the channel in which the corresponding data register is read. For

example, in the case where the SYN1 flag is not set, the AUTOSET flag is set. When the data register AUXADC_DAT0 is read, the A/D converter will sample the next value for channel 1 immediately.

If multiple channels are selected at the same time, the task will be performed sequentially on every selected channel. For example, if AUXADC_CON1 is set to 0x3f, i.e. 6 channels are selected, the state machine in the unit will start sampling from channel 6 to channel 0 and save the values of each input channel in respective registers. The same process also applies to the timer-triggered mode.

In the timer-triggered mode, the A/D converter samples the value for the channels in which the corresponding SYN flags are set when the TDMA timer counts to the value specified in register TDMA_AUXEV1 placed in the TDMA timer. For example, if AUXADC_CON0 is set to 0x3f, the 6 channels will be selected to be in the timer-triggered mode. The state machine will sample the 6 channels sequentially and save the values in registers from AUXADC_DAT0 to AUXADC_DAT5, as it does in the immediate mode.

AUTOCLR_n in register AUXADC_CON3 is set when it is intended to sample only once after setting up the timer-triggered mode. If the AUTOCLR1 flag is set, after the data for the channels in the timer-triggered mode are stored, the SYN_n flags in register AUXADC_CON0 will be cleared.

The uses of the immediate mode and timer-triggered mode are mutually exclusive in terms of individual channels.

There are only two external pins (channel 4 ~ 5) for voltage detection. Other channels (0 ~ 3) are for battery voltage, battery current, charger and battery temperature respectively. Channel 9 is used for audio.

Touch panel

Figure 39. Touch panel circuit structure

Besides the normal sampling of external input voltage, the AUXADC includes the sampling of the touch panel function. For specified axis, the software should program AUX_TS_CMD first then trigger the sample of touch panel in register AUX_TS_CON. The touch panel sampling waveform is shown as the following. After the software polls the status bit in register AUXADC_CON3 to know that the touch panel sample is finished, the software can read back the specified axis value from register AUX_TS_DAT0.

Figure 40. Touch panel sampling waveform

S: Start bit
A2 ~ A0: Addressing bits
Mode: 10-bit or 8-bit
SE/DF: Single end or differential mode
PD1 ~ 0: Power down command

These values are defined in register AUX_TS_CMD. The table below shows the relationship between AUX_TS_CMD and touch panel control signals.

Table 49. Relationship between commands and touch panel control signals

A2	A1	A0	SE/DFB	CHN_SEL	ADC In	X switches	Y switches	+REF	-REF
0	0	1	0	C	X+	OFF	ON	Y+	Y-
0	1	0	0	F	X-	OFF	ON	Y+	Y-
0	1	1	0	C	X+	X+ OFF X- ON	Y+ ON Y- OFF	Y+	X-
1	0	0	0	E	Y-	X+ OFF X- ON	Y+ ON Y- OFF	Y+	X-
1	0	1	0	D	Y+	ON	OFF	X+	X-
1	1	0	0	E	Y-	ON	OFF	X+	X-

Table 2 AUXADC channel description

AuxADC Channel ID	Description
Channel 0	VBAT

AuxADC Channel ID	Description
Channel 1	ISENSE
Channel 2	CHRIN
Channel 3	BATON (BATtemp)
Channel 4	AUXIN4 (external)
Channel 5	ACCDET (external)
Channel 9	ClassAB
Channel 12	XP / External
Channel 13	YP / External
Channel 14	YM / External
Channel 15	XM / External

3.13.1 Register Definition

Module name: AUXADC Base address: (+A0790000h)

Address	Name	Width	Register Function
A0790000	<u>AUXADC_CON0</u>	16	AuxiliaryADC Control Register 0 These bits define whether the corresponding channel is sampled or not in the timer-triggered mode. It is associated with the timing offset register TDMA_AUXEV1. It supports multiple flags. The flags can be automatically cleared after those channels are sampled if AUTOCLR1 in register AUXADC_CON3 is set.
A0790004	<u>AUXADC_CON1</u>	16	AuxiliaryADC Control Register 1 These bits are set individually to sample the data for the corresponding channel. It supports multiple flags.
A079000C	<u>AUXADC_CON3</u>	16	AuxiliaryADC Control Register 3
A0790010	<u>AUXADC_DAT0</u>	16	AuxiliaryADC Channel 0 Register (VBAT)
A0790014	<u>AUXADC_DAT1</u>	16	AuxiliaryADC Channel 1 Register (ISENSE)
A0790018	<u>AUXADC_DAT2</u>	16	AuxiliaryADC Channel 2 Register (CHRIN)
A079001C	<u>AUXADC_DAT3</u>	16	AuxiliaryADC Channel 3 Register (VBATTMP)
A0790020	<u>AUXADC_DAT4</u>	16	AuxiliaryADC Channel 4 Register (External)
A0790024	<u>AUXADC_DAT5</u>	16	AuxiliaryADC Channel 5 Register (External/ACCDET)
A0790034	<u>AUXADC_DAT9</u>	16	AuxiliaryADC Channel 9 Register (ClassAB)
A0790040	<u>AUXADC_DAT12</u>	16	AuxiliaryADC Channel 12 Register (External)
A0790044	<u>AUXADC_DAT13</u>	16	AuxiliaryADC Channel 13 Register (External)
A0790048	<u>AUXADC_DAT14</u>	16	AuxiliaryADC Channel 14 Register (External)
A079004C	<u>AUXADC_DAT15</u>	16	AuxiliaryADC Channel 15 Register (External)
A0790054	<u>AUX_TS_CMD0</u>	16	Touch Screen Sample Command 0
A0790058	<u>AUX_TS_CON</u>	16	Touch Screen Control
A079005C	<u>AUX_TS_DAT0</u>	16	Touch Screen Sample DATA 0
A0790070	<u>AUXADC_DAT_ZCV</u>	16	AuxiliaryADC ZCV Sample DATA
A07900D0	<u>AUXADC_CON4</u>	16	AuxiliaryADC Control Register 4

Address	Name	Width	Register Function
A07900D4	AUX TS_CMD1	16	Touch Screen Sample Command 1
A07900D8	AUX TS_DAT1	16	Touch Screen Sample DATA 1

A0790000 AUXADC_CON0 Auxiliary ADC Control Register 0 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	SYN15	SYN14	SYN13	SYN12			SYN9				SYN5	SYN4	SYN3	SYN2	SYN1	SYN0

1	IMM1	IMM1	Channel 1 immediate mode 0: The channel is not selected. 1: The channel is selected.
0	IMM0	IMM0	Channel 0 immediate mode 0: The channel is not selected. 1: The channel is selected.

A079000C AUXADC_CON3 Auxiliary ADC Control Register 3 0010

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	AUTO SET				RSV		AUTO CLR1		SOFT _RST			BYPASS_SL P_ZC V_TRIGGER				AUXADC_STA
Type	R/W				R/W		R/W		R/W			R/W				RO
Reset	0				0		0		0			1				0

Bit(s)	Mnemonic	Name	Description
15	AUTOSET	AUTOSET	Defines the auto-sample mode of the module. In auto-sample mode, each channel with its sample register being read can start sampling immediately without configuring the control register AUXADC_CON1 again.
11	RSV	RSV	Please keep 1'b0
9	AUTOCLR1	AUTOCLR1	Defines the auto-clear mode of the module for event 1. In the auto-clear mode, each timer-triggered channel acquires samples of specified channels once the SYNn bit in register AUXADC_CON0 is set. The SYNn bits are automatically cleared and the channel is not enabled again by the timer event except when the SYNn flags are set again. 0: The automatic clear mode is not enabled. 1: The automatic clear mode is enabled.

7	SOFT_RST	SOFT_RST	Software reset AUXADC state machine	0: Normal function 1: Reset AUXADC state machine
4	BYPASS_SLP_ZCV_TRIGGER	BYPASS_SLP_ZCV_TRIGGER	Bypass zcv triggering after sleep mode setting	0: trigger zcv measuring after sleep mode 1: bypass zcv measuring trigger after sleep mode
0	AUXADC_STA	AUXADC_STA	Defines the state of the module	0: This module is idle. 1: This module is busy.

A0790010 AUXADC_DAT0 AuxiliaryADC Channel 0 Register (VBAT) 0000

※ Please refer to “**PMU**” datasheet for other AuxADC related settings:

- Sampling cycle control: Please see “AUX_CON4” and “AUX_CON5”

3.13.2 General Programming Guide

All register writes will occur in sequence. However, due to synchronization time, any reads after writes need to be delayed by three dummy reads.

3.13.3 Usage Programming Guide

There are two modes to program the AUXADC to sample: immediate mode and synchronous mode. The following are notes on programming each mode:

Immediate mode sampling is accomplished by programming AUXADC_CON1 with the channels to be sampled. After programming, it is necessary to perform three dummy reads on AUXADC_CON3. After the dummy reads, the next read of AUXADC_CON3 will be valid. After sampling is done, it is necessary to program AUXADC_CON1 back to zero before sampling again.

Synchronous mode sampling is accomplished by programming AUXADC_CON0 with the channels to be sampled. Then it is necessary to program TDMA_EVTENA7 to 0x2. After the sample is done, TDMA_EVTENA7 must be programmed to 0x0 with waiting of two frames before sampling again.

3.13.4 Performance Programming Guide

For details on adjusting the performance of ADC sampling, please refer to registers AUX_CON4, AUX_CON5 and AUX_CON6 in the **PMU** datasheet.

3.13.5 AUXADC PDN

AUXADC is located in A-die. Due to limitation, one of UART1,2,3 clocks must be turned on in order to use AUXADC. Please clear the corresponding PDN bits to enable the AUXADC clock (bit 2 or 3 of ACFG_CLK_CG).

3.13.6 Notice

The 4 TP pins – PAD_XP, PAD_XM, PAD_YP, PAD_YM, are used as EINT pins when no R-touch is used in the system. Therefore, please make sure the pin settings are correct.

3.14 USB Device Controller

3.14.1 General Description

This chip provides a USB function interface which complies with Universal Serial Bus Specification Rev 1.1. The USB device controller supports only full-speed (12Mbps) operation. The chip can make use of this widely available USB interface to transmit/receive data with USB hosts, typically PC/laptop. There are 6 endpoints in the USB device controller besides the mandatory control endpoint, 4 of which are for IN transactions and 2 endpoints are for OUT transactions. Word, half-word, and byte access are all allowed for loading and unloading the FIFO. The controller features 4 DMA channels to accelerate the data transfer for ACL and SCO data streams. The features of the endpoints are:

1. Endpoint 0: The control endpoint feature 64 bytes FIFO and accommodates maximum packet size of up to 64 bytes. DMA transfer is not supported.
2. IN endpoint 1: It features 64 bytes FIFO and accommodates maximum packet size of up to 64 bytes. GDMA Channel 4 Write Transfer is supported.
3. IN endpoint 2: It features 64 bytes FIFO and accommodates maximum packet size of up to 64 bytes. GDMA Channel 6 Write Transfer is supported.
4. IN endpoint 3: It features 16-byte FIFO and accommodates maximum packet size of 16 bytes. GDMA Transfer is not supported.
5. IN endpoint 4: It features 16-byte FIFO and accommodates maximum packet size of 16 bytes. GDMA Transfer is not supported.

6. OUT endpoint 1: It features 64 bytes FIFO and accommodates maximum packet size of 64 bytes. GDMA Channel 5 Read Transfer is supported.
7. OUT endpoint 2: It features 64 bytes FIFO and accommodates maximum packet size of 64 bytes. GDMA Channel 7 Read Transfer is supported.

For each endpoint except for the control endpoint, when the packet size is smaller than half the size of the FIFO, at most 2 packets can be buffered.

This unit is highly software configurable. All endpoints except for the control endpoint can be configured to be a bulk, interrupt or isochronous endpoints. Composite devices are also supported. IN endpoint 1 and OUT endpoint 1 share the same endpoint number but they can be used separately. So is the situation for the endpoint 2.

The USB device uses the cable-powered feature for the transceiver but only drains little current. An internal pull-up resistor is integrated across Vbus and D+ signal. The switch on/off of the pull-up resistor can be configured through the internal register. Two additional external serial resistors might be needed to place on the output of D+ and D- signals to make the output impedance equivalent to 28~44Ohm.

Figure 1. USB11 controller system diagram

3.14.2 Terminology

RW: Writable, Readable.

RO: Read-only. Value never changes.

WO: Write-only.

W1: Write-once. Readable.

RU: Read-only but value updated by the design.

W1C: Readable. Write 1 to bitwise-clear.

RC: Clear on read.

A1: Auto-set by the design. Can be read and write 0 to clear.

A0: Auto-cleared by the design. Can be read and write 1 to set.

DC: Don't care.

OTHER: Others. Mixed attribute. Refer to bit description.

RSV: Reserved. The read/write behavior to this bit is undefined.

3.14.3 Register Definition

00 **USB_FADDR** USB Function Address Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									UPD							FADDR
Type									RW							RW
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	UPD	This is an 8bit register that should be written with the functions 7-bit address (received through a SET_ADDRESS description). It is then used for decoding the function address in subsequent token packets. When set by the MCU, the core will wait for an SOF token from the time INPKTRDY is set before sending the packet
6:0	FADDR	Function address of device

01 **USB_POWER** USB Power Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									ISOUPDATE			SWRSTENAB	RESET	RESUME	SUSPMODE	SUSPENAB
Type									RW			RU	RU	RW	RU	RW
Reset									0			0	0	0	0	0

Bit(s)	Name	Description
7	ISOUPDATE	When set by the MCU, the core will wait for an SOF token from the time INPKTRDY is set before sending the packet
4	SWRSTENAB	Set by the MCU to enable the mode in which the device can only be reset by the software after reset signals are detected on the bus. In case the software is delayed by other high priority processes and cannot make it to read the command from the buffer before the hardware reset the device after the reset signal is detected on the bus, the command will be lost. That is why the software reset mode is effective. When the flag is enabled, the hardware state machine cannot reset itself but by the software. In that sense, the software and hardware can keep synchronous detecting the reset signal.
3	RESET	The read-only bit is set when Reset signaling is present on the bus
2	RESUME	Set by the MCU to generate Resume signaling when the function is in the suspend mode. The MCU should clear this bit after 10ms (maximum 15ms) to end Resume signaling
1	SUSPMODE	Set by the USB core when the Suspend mode is entered Cleared when the Resume bit of this register is set.
0	SUSPENAB	Set by the MCU to enable device into the Suspend mode when Suspend

Bit(s)	Name	Description
		signaling is received on the bus

0002 **USB_INTRIN** USB IN Endpoints Interrupt Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												EP4_IN	EP3_IN	EP2_IN	EP1_IN	EP0

Bit(s)	Name	Description
2	EP2_OUTE	1b0: Disable OUT Endpoint 2 interrupt event 1b1: Enable OUT Endpoint 2 interrupt event
1	EP1_OUTE	1b0: Disable OUT Endpoint 1 interrupt event 1b1: Enable OUT Endpoint 1 interrupt event

0B **INTRUSBE** USB General Interrupt Enable Register 06

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												POWERDWN_E	SOFE	RESET_E	RESUME_E	SUSPEND_E
Type												RW	RW	RW	RW	RW
Reset												0	0	1	1	0

Bit(s)	Name	Description
4	POWERDWN_E	Enables power-down interrupt

Bit(s)	Name	Description
3	SOF_E	Enables SOF interrupt
2	RESET_E	Enables reset/babble interrupt
1	RESEUM_E	Enables resume interrupt
0	SUSPEND_E	Enables suspend interrupt

0C **USB_FRAME1** USB Frame Count #1 Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	NUML	The lower 8 bits of the frame number

0D **USB_FRAME2** USB Frame Count #2 Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset														0	0	0

Bit(s)	Name	Description
2:0	NUMH	The upper 3 bits of the frame number

0E **USB_INDEX** USB Endpoint Register Index 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset													0	0	0	0

The register determines which endpoint control/status registers are to be accessed at addresses USB+10h to USB+17h. Each IN endpoint and OUT endpoint has its own set of control/status registers. Only one set of IN control/status and one set of OUT control/status registers appear in the memory map at a time. Before accessing the control/status registers of an endpoint, the endpoint number should be written to the USB_INDEX register to ensure that the correct control/status registers appear in the memory map.

Bit(s)	Name	Description
3:0	INDEX	Index of the endpoint

0F **USB_RSTCTRL** USB Reset Control 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SWR ST							
Type									RW							

Reset									0				0	0	0	0
-------	--	--	--	--	--	--	--	--	---	--	--	--	---	---	---	---

Bit(s)	Name	Description
7	SWRST	If the flag SWRSTENAB in register USB_POWER is set to 1, the software enable mode will be enabled, and the device can be reset by writing 1 to this flag.
3:0	RSTCNTR	Signifies the duration of the reset operation after reset signal is detected on the bus. It is only enabled when software reset is not enabled. If the value is 0, the duration will be 2.5us. Otherwise, the duration will be this value multiplied by 341 then added by 2.5 in us unit. The range consequently starts from 2.5us to 5122.5us.

11 USB_EP0_CSR USB Control/Status Register for Endpoint 0 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SSETUPEND	SOUTPKTRDY	SENDSTALL	SETUPEND	DATAEND	SENTSTALL	INPKTRDY	OUTPKTRDY
Type									A0	A0	A0	RU	A0	A1	A0	RU
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	SSETUPEND	The MCU writes 1 to this bit to clear the SETUPEND bit. It is cleared automatically. Only active when a transaction is started.
6	SOUTPKTRDY	The MCU writes 1 to this bit to clear the OUTPKTRDY bit. It is cleared automatically. Only active when an OUT transaction is started.
5	SENDSTALL	The MCU writes 1 to this bit to terminate the current transaction. The STALL handshake will be transmitted, and this bit will be cleared automatically.
4	SETUPEND	This bit will be set when a control transaction ends before the DATAEND bit is set. An interrupt will be generated and FIFO flushed at this time. The bit is cleared by the MCU writing 1 to the SSETUPEND bit.
3	DATAEND	The MCU sets this bit: 1. When setting INPKTRDY for the last data packet. 2. When clearing OUTPKTRDY after unloading the last data packet. 3. When setting INPKTRDY for a zero length data packet. It is cleared automatically.
2	SENTSTALL	This bit is set when a STALL handshake is transmitted. The MCU should clear this bit by writing 0 to it.
1	INPKTRDY	The MCU sets up this bit after loading a data packet into the FIFO. It is cleared automatically when the data packet is transmitted. An interrupt is generated when this bit is set.
0	OUTPKTRDY	This bit is set when a data packet is received. An interrupt is generated when this bit is set. The MCU clears this bit by setting up the SOUTPKTRDY bit.

16 USB_EP0_COUNT_I EP0 Received Bytes Count Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
-----	----	----	----	----	----	----	---	---	---	---	---	---	---	---	---	---

Name										EP0_COUNT						
Type										RU						
Reset										0	0	0	0	0	0	0

The register indicates the number of received data bytes in the endpoint 0. The value returned is valid while the OUTPKTRDY bit of the USB_EP0_CSR register is set. The register is active when the USB_INDEX register is set to 0.

Bit(s)	Name	Description
6:0	EP0_COUNT	Number of received data bytes in the endpoint 0

10 USB EP_INMAXP USB Maximum Packet Size Register for IN Endpoint 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

The register holds the maximum packet size for transactions through the currently selected IN endpoint - in units of one byte. When setting up the value, the programmer should note the constraints placed by the USB Specification on the packet size for bulk interrupt and isochronous transactions in full speed operation. There is an INMAXP register for each IN endpoint except for endpoint 0. The registers are active when the USB_INDEX register is set to 1, 2, 3, and 4 respectively.

The value written to this register should match the wMaxPacketSize field of the standard endpoint descriptor for the associated endpoint. A mismatch may cause unexpected results. If a value is bigger than the configured IN FIFO size for the endpoint written to the register, the value will be automatically changed to the IN FIFO size. If the value written to the register is smaller than or equal to half the IN FIFO size, two IN packets can be buffered. The configured IN FIFO size for the endpoint 1, 2, and 3, are 16 bytes, 64 bytes, and 64 bytes respectively.

The register is reset to 0. If the register is changed after the packets are sent from the endpoint, the endpoint IN FIFO should be completely flushed after writing the new value to the register.

Bit(s)	Name	Description
7:0	MAXP	Maximum packet size (unit: byte)

11 USB EP_INCSR1 USB Control/Status Register #1 for IN Endpoint 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									ABORTPKT_EN	CLRDATA_OG	SENTSTAL	SENDSTAL	FLUSHFIFO	UNDERRUN	FIFOEMPTY	INPKTRDY
Type									RW	A0	A1	RW	A0	A1	RU	A0
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	ABORTPKT_EN	When MCU writes 1 to ABORTPKT_EN, FLUSHFIFO switches to abort the packet function. This bit should be enabled before FLUSHFIFO is set. If FLUSHFIFO is set and ABORTPKT_EN is enabled the data loaded into FIFO will be discarded. After

Bit(s)	Name	Description
6	CLRDATA TOG	the packet is aborted, EP will issue an interrupt. The programmer should wait for this interrupt to make sure the packet is aborted
5	SENTSTALL	The MCU writes 1 to this bit to reset the endpoint IN data toggle to 0 The bit is set when a STALL handshake is transmitted. The FIFO is flushed and the INPKTRDY bit is cleared. The MCU should clear this bit by writing 0 to this bit.
4	SENDSTALL	The MCU writes 1 to this bit to issue a STALL handshake to an IN token. The MCU clears this bit to terminate the stall condition
3	FLUSHFIFO	The MCU writes 1 to this bit to flush the next packet to be transmitted from the endpoint IN FIFO. The FIFO pointer is reset and the INPKTRDY bit is cleared. If the FIFO contains two packets, FLUSHFIFO will need to be set twice to completely clear the FIFO. FLUSHFIFO should only be used when INPKTRDY is set. At other times, it may cause data corruption. If ABORTPKT_EN is enabled and this bit is set, the function of this bit will become ABORTPKT to abort the next packet to be transmitted from the endpoint IN FIFO and does not need to set INPKTRDY. It is the same with the FLUSHFIFO function. This bit is only active when the endpoint is idle.
2	UNDERRUN	In isochronous mode, this bit is set when a zero length data packet is sent after receiving an IN token with the INPKTRDY bit not set. In Bulk/Interrupt mode, this bit is set when a NAK is returned in response to an IN token. The MCU should clear this bit by writing a 0 to this bit
1	FIFONOTEMPTY	This bit is set when there is at least 1 packet in the IN FIFO
0	INPKTRDY	The MCU sets up this bit after loading a data packet into the FIFO. Only active when an IN transaction is started. It is cleared automatically when a data packet is transmitted. An interrupt will be generated (if enabled) when the bit is cleared

12 **USB EP INCSR2** USB Control/Status Register #2 for IN Endpoint 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									AUTO SET	ISO	MODE	DMA ENAB	FRCDATATOG			
Type									RW	RW	RW	RW	RW			
Reset									0	0	0	0	0			

Bit(s)	Name	Description
7	AUTOSET	If the MCU sets up the bit, INPKTRDY will be automatically set when the data of the maximum packet size (value in INMAXP) is loaded into the IN FIFO. If a packet of smaller than the maximum packet size is loaded, INPKTRDY will have to be set manually. When 2 packets are in the IN FIFO, INPKTRDY will also be automatically set when the first packet is sent if the second packet is the maximum packet size
6	ISO	The MCU sets up this bit to enable the IN endpoint for isochronous transfer and clears it to enable the IN endpoint for bulk/interrupt transfers
5	MODE	The MCU sets up this bit to enable the endpoint direction as IN and clears it to enable the endpoint direction as OUT. It is valid only when the same endpoint FIFO is used for both IN and OUT transactions.
4	DMAENAB	The MCU sets up this bit to enable the DMA request for the IN endpoint.
3	FRCDATATOG	The MCU sets up this bit to force the endpoints IN data toggle to switch after each data packet is sent regardless of whether an ACK has been received. This can be used by interrupt IN endpoints which are used to communicate

Bit(s)	Name	Description
		rate feedback for isochronous endpoints

13 [USB_EP_OUTMAXP](#) USB Maximum Packet Size Register for OUT Endpoint 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset									0	0	0	0	0	0	0	0

This register holds the maximum packet size for transactions through the currently selected OUT endpoint (unit: byte). When setting up this value, the programmer should note the constraints placed by the USB specification on packet sizes for bulk, interrupt, and isochronous transactions in full speed operations. There is an OUTMAXP register for each OUT endpoint except for endpoint 0. The registers are active when the USB_INDEX register is set to 1 and 2 respectively.

The value written to this register should match the wMaxPacketSize field of the standard endpoint descriptor for the associated endpoint. A mismatch may cause unexpected results. The total amount of data represented by the value written to this register must not exceed the FIFO size for the OUT endpoint and should not exceed half the FIFO size if double buffering is required. If a value bigger than the configured OUT FIFO size for the endpoint is written to the register, the value will be automatically changed to the OUT FIFO size. If the value written to the register is smaller than or equal to half the OUT FIFO size, two OUT packets can be buffered. The configured IN FIFO size for the endpoint 1, 2, and 3 are both 16, 64, and 64 bytes, respectively.

Bit(s)	Name	Description
7:0	MAXP	Maximum packet size (unit: byte)

14 [USB_EP_OUTCSR1](#) USB Control/Status Register #1 for OUT Endpoint 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									CLRDTATOG	SENTSTALL	SENDSTALL	FLUSHFIFO	DATAERROR	OVERRUN	FIFOFULL	RXPKT RDY
Type									A0	A1	RW	A0	RU	A1	RU	A1
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	CLRDTATOG	The MCU writes 1 to this bit to reset the endpoint data toggle to 0.
6	SENTSTALL	The bit is set when a STALL handshake is transmitted. The MCU should clear this bit by writing 0 to it.
5	SENDSTALL	The MCU writes 1 to this bit to issue a STALL handshake. The MCU clears this bit to terminate the stall condition. This bit will have no effect if the OUT endpoint is in the isochronous mode
4	FLUSHFIFO	The MCU writes 1 to this bit to flush the next packet to be read from the endpoint OUT FIFO. If the FIFO contains two packets, FLUSHFIFO will need to be set twice to completely clear the FIFO. FLUSHFIFO should only be used when OUTPKTRDY is set. At other times, it may cause data corruption.
3	DATAERROR	The bit is set when OUTPKTRDY is set if the data packet has a CRC or bit

Bit(s)	Name	Description
		stuff error.
2	OVERRUN	It is cleared when OUTPKTRDY is cleared. This bit is only valid in the isochronous mode. The bit will be set if an OUT packet cannot be loaded into the OUT FIFO. The MCU should clear the bit by writing 0 to it. This bit is only valid in the isochronous mode.
1	FIFOFULL	This bit is set when no more packets can be loaded into the OUT FIFO
0	RXPKTRDY	The bit is set when a data packet has been received. The MCU should clear (write 0 to it) the bit when the packet is unloaded from the OUT FIFO. An interrupt will be generated when the bit is set. When the receiving null packet is received, OUTPKTRDY will be set after USB_INTROUT1 is high.

15 [USB_EP_OUTCS](#) **USB Control/Status Register #2 for OUT Endpoint** 00
[R2](#)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									AUTO CLEAR	ISO	DMA ENAB	DMA MODE				
Type									RW	RW	RW	RW				
Reset									0	0	0	0				

Bit(s)	Name	Description
7	AUTOCLEAR	If the MCU sets up this bit, the OUTPKTRDY bit will be automatically cleared when a packet of OUTMAXP bytes is unloaded from the OUT FIFO. When packets of smaller than the maximum packet size are unloaded, OUTPKTRDY will have to be cleared manually.
6	ISO	The MCU sets up this bit to enable the OUT endpoint for isochronous transfers and clears it to enable the OUT endpoint for bulk/interrupt transfers
5	DMAENAB	The MCU sets up this bit to enable the DMA request for the OUT endpoint
4	DMA MODE	Two modes of DMA operation are supported: DMA mode 0 in which a DMA request is generated for all received packets, together with an interrupt (if enabled). DMA mode 1 in which a DMA request (but no interrupt) is generated for OUT packets of size OUTMAXP bytes and an interrupt (but no DMA request) is generated for OUT packets of any other size. The MCU sets up the bit to select DMA mode 1 and clears this bit to select DMA mode 0.

16 [USB_EP_COUNT](#) **USB OUT Endpoint Byte Counter Register LSB Part for** 00
[1](#) **Endpoint**

Reset									0	0	0	0	0	0	0	0

The register provides MCU access to the FIFO for the endpoint 3. Writing to this register will load data to the FIFO for the endpoint 3. Reading this register will unload data from the FIFO for the endpoint 3.

The register provides word, half word, and byte mode accesses. If word or half word accesses are performed, the less significant byte will correspond to the prior byte to load to or unload from the FIFO.

Bit(s)	Name	Description
7:0	FIFO3_DB0	The first byte to be loaded to or unloaded from the FIFO.

2D USB EP3_FIFO_DB1 USB Endpoint 3 FIFO Register DB1 00

Bit(s)	Name	Description
5	NULLPKT_FIX	If NULLPKT_FIX is set to 1, the USB controller will not issue a DMAreq when a null packet is received.
1	DMPULLUP	Pull-up enabling pin. Enables the pull-up 1.5KOhm pull-up on D pin as a full speed device by setting it to high
0	DPPULLUP	Pull-up enabling pin. Enables the pull-up 1.5KOhm pull-up on D+ pin as a full speed device by setting it to high

3.14.4 System Integration Guide

3.14.4.1 USB device configuration

The target audience of this section is the software engineer.

The USB device controller features one control endpoint and 6 other endpoints. The configuration of interfaces and endpoints can be accommodated by software for specific functions, basically supporting Bluetooth HCI, and device firmware upgrade.

Bluetooth HCI transport layer defines the configuration of endpoints and interfaces.

- ✓ One voice channel with 16-bit encoding.

Endpoint	Endpoint type	Max. packet size (bytes)	Max. bandwidth (bytes/ms)	Min. bandwidth (bytes/ms)	Double buffer in controller	Generic DMA
Endpoint 0 (command)	Control	64			No	No
Endpoint 1 IN	Bulk (IN)	64		1024	No	Yes
Endpoint 2 OUT	Bulk (OUT)	64		1024	No	Yes
Endpoint 2 IN	Bulk (IN)	64	1024		No	Yes
Endpoint 2 OUT	Bulk (OUT)	64	1024		No	Yes
Endpoint 3 IN	Interrupt (IN)	16		16	No	No
Endpoint 4 IN	Interrupt (IN)	16		16	No	No

*When the maximum packet size is smaller than one half of the device FIFO size (64 bytes), the double buffer will be automatically enabled by hardware.

The pull-up resistor on the USB transceiver is initially disconnected when boot-up. No external resistor is required. The software should enable it after performing the configuration of the USB device controller.

3.14.4.2 System Infrastructure Configuration

The clock, interrupt and DMA are defined as the system infrastructure. It requires several steps to bring up the USB. Those steps should be done in sequence to prevent from malfunction.

Power-on

1. Enable USB PLL.
2. Enable USB clock after USB PLL is settled.
3. Unmask the USB interrupt in the interrupt controller.
4. Enable the pull-up resistor.

The USB device controller can generate the interrupt when conditions are met as defined in USB_INTRINE, USB_INTROUTE, and USB_INTRUSBE.

The generic DMA controller is used to move data from or to the USB device controller. The USB device controller will use at most 4 DMA channels for ACL and SCO. The user should use the half-channel DMA since only the half channel DMA has the hardware flow control.

The USB FIFO provides byte and word accesses to the read/write port of USB_EP0_FIFO, USB_EP1_FIFO, USB_EP2_FIFO, USB_EP3_FIFO and USB_EP4_FIFO. If the data buffer allocated in memory is word aligned, the user can enable word transfer in the DMA controller. If the data buffer allocated in memory is not word aligned, the user should set to byte aligned and set B2W in DMAx_CON to 1 to enable fast byte-to-word transfer.

3.14.4.3 Power On/Off USB PHY and Controller Sequence

Power-on sequence after plug-in

1. Turn on Vusb(PHY 3.3v power) – The control register is in PMIC document.
2. Turn on USB AHB clock(78MHz) – The control register is in config document.
3. Turn on internal 48MHz PLL – the control register is in clock document.
4. Wait for 50 usec. (PHY 3.3v power stable time)
5. Turn on USB PHY BIAS current control → reg[USB+08C1h] bit3 = 1. (RG_USB11_FSL_S_ENBGRI).
6. Wait for 10 usec.
7. Set up D+ pull up register for connecting Host → reg[USB+0240h] bit 0=1(PUB)

Power-off sequence after plug-out

1. Release D+ pull up register for disconnecting Host → Setting reg[USB+0240h] bit 0=0 (PUB)
2. Turn off USB PHY BIAS current control → reg[USB+08C1h] bit3 = 0. (RG_USB11_FSL_S_ENBGRI).
3. Turn off Vusb (PHY 3.3v power) – The control register is in PMIC document

3.15 Accessory Detector

3.15.1 General Description

The hardware accessory detector (ACCDDET) detects plug-in/out of multiple types of external components. Based on the suggested circuit (see **Figure 41**), this design supports 3 types of external components, which are microphone, hook-switch and TV-OUT line. This design uses the internal 2-bit comparator to separate external components. The de-bounce scheme is also supported to resist

uncertain input noises. When the plug-in/out state is stable, the PWM unit of ACCDET will enable the comparator, MBIAS and threshold voltage of the comparator periodically for the plugging detection. With suitable PWM settings, very low-power consumption can be achieved when the detection feature is enabled. In order to compensate the delay between the detection login and comparator, the delay enabling scheme is adopted. Given the suitable delay number compared to the rising edge of PWM high pulse, the stable plugging state can be prorogated to digital detection logic. Then the correct plugging state can be detected and reported.

Figure 42 shows the state machine without TV-OUT mode. The state machine is executed by the software to control the ACCDET design. The ACCDET design will send one interrupt to acknowledge the software after the ACCDET input state is changed and the duration of the state is longer than de-bounce time. The software needs to read out the memorized ACCDET input state and follow the recommend state machine to program the register in it.

Figure 41. Suggested Accessory Detection Circuit.

Figure 42. The State machine between Microphone and Hook-Switch plug-in/out change.

3.15.2 Pulse Width Modulation

The ACCDET design also provides one Pulse-Width-Modulation (PWM) to enable the comparator, microphone's bias current and the threshold voltage of the comparator periodically. With suitable PWM and settings for delayed enabling, the ACCDET can achieve very low power consumption and accurate plug-in/out detection. Figure 43 shows a timing diagram example of such PWM design. The output from PWM keeps being at "0" until the value of the counter is smaller than the programmed threshold.

Figure 43. PWM waveform.

3.15.3 Register Definition

Module name: ACCDET base address: (+A0750000h)

Address	Name	Width	Register function
A0750000	ACCDDET_RSTB	32	ACCDDET software reset register

Mne								IRQ_C LR								IRQ
Type								RW								RW
Reset								0								0

Overview: When the interrupt of ACCDET is asserted, IRQ_CLR must be set to 1 to clear the interrupt status. This bit will pause all activities in the ACCDET design until both interrupt status and IRQ_CLR are cleared. The software should write 1 to IRQ_CLR first to clear the interrupt (IRQ). After that, if pclk gating is enabled, the software should read ACCDET_IRQ_STS again to make IRQ_CLR self-reset to 0.

Bit(s)	Mnemonic	Name	Description
8	IRQ_CLR	IRQ_CLR	Clears interrupt status of ACCDET unit
0	IRQ	IRQ	Interrupt status of ACCDET unit Because this register will be cleared by hardware, the interrupt edge-sensitive scheme should be adopted for this design.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												ACCDDET_IN_DEFAULT_REFRESH_EN			ACCDDET_IN_DEFAULT	
Type												RW			RW	
Reset												0			0	0

Overview: The default value of sample_accdet_in and memorised_accdet_in can be set by software instead of using the default value set by hardware (i.e. 3). ACCDET_DEFAULT_REFRESH_EN is the enable bit controlling whether to use this additional function. The value of sample_accdet_in and memorized_accdet_in will change when accdet_en rises from low to high. Note that if software reset is applied when accdet_en is high, the default value of sample_accdet_in and memorized_accdet_in will also be loaded when the software reset is de-asserted.

Bit(s)	Mnemonic	Name	Description
4	ACCDDET_IN_DEFAULT_REFRESH_EN	ACCDDET_IN_DEFAULT_REFRESH_EN	Enable signal for whether to load accdet_in_default 0: accdet_in_default will not be loaded. 1: accdet_in_default will be loaded.
1:0	ACCDDET_IN_DEFAULT	ACCDDET_IN_DEFAULT	Default value of accdet_in set by software

3.16 SD Memory Card Controller (MSDC0)

3.16.1 Introduction

The controller fully supports the SD memory card bus protocol as defined in SD Memory Card Specification Part 1 Physical Layer Specification version 2.0.

Furthermore, the controller also partially supports the SDIO card specification version 2.0. However, the controller can only be configured as the host of the SD memory card. Hereafter, the controller is also abbreviated as the SD controller. The following are the main features of the controller.

- Interface with MCU by APB bus
- 16/32-bit access on APB bus
- 16/32-bit access for control registers
- 32-bit access for FIFO
- Built-in 32 bytes FIFO buffers for transmit and receive, FIFO is shared for transmit and receive
- Built-in CRC circuit
- CRC generation can be disabled
- DMA supported
- Interrupt capabilities
- Data rate up to 48 Mbps in serial mode, 48x4 Mbps in parallel model, the module is targeted at 48 MHz operating clock
- Serial clock rate on SD bus is programmable
- Card detection capabilities during sleep mode
- Controllability of power for memory card
- Does not support SPI mode for SD memory card
- Does not support multiple SD memory cards

3.16.2 Overview

3.16.2.1 Pin Assignment

The following lists pins required for the SD memory card. Table 50 shows how the pins are shared. Note that all I/O pads have embedded both pull-up and pull-down resistors because they are shared by the SD memory card. The pull-down resistors for these pins can be used for power saving. If optimal pull-up or pull-down resistors are required on the system board, all embedded pull-up and pull-down resistors can be disabled by programming the corresponding control registers. The VDDPD pin is used for power saving. Power for the SD memory card can be shut down by programming the corresponding control register. The WP (Write Protection) pin is used to detect the status of the Write Protection Switch on the SD memory card.

Table 50. Sharing of pins for SD memory card controller

No.	Name	Type	MMC	SD	Description
-----	------	------	-----	----	-------------

No.	Name	Type	MMC	SD	Description
1	SD_CLK	O	CLK	CLK	Clock
2	SD_DAT3	I/O/PP		CD/DAT3	Data Line [Bit 3]
3	SD_DAT0	I/O/PP	DAT0	DAT0	Data Line [Bit 0]
4	SD_DAT1	I/O/PP		DAT1	Data Line [Bit 1]
5	SD_DAT2	I/O/PP		DAT2	Data Line [Bit 2]
6	SD_CMD	I/O/PP	CMD	CMD	Command Or Bus State
7	SD_PWRON	O			VDD ON/OFF
8	SD_WP	I			Write Protection Switch in SD
9	SD_INS	I	VSS2	VSS2	Card Detection

3.16.2.2 Card Detection

For SD memory card, detection of card insertion/removal by hardware is supported, and a dedicated pin “INS” is used to perform card insertion and removal for SD. The pin “INS” will be connected to the pin “VSS2” of a SD connector (see **Figure 45**).

Figure 45. Card detection for SD memory card

3.16.3 Register Definition

Module name: MSDC0 base address: (+A0130000h)

Address	Name	Width	Register function
---------	------	-------	-------------------

Address	Name	Width	Register function
A0130000	<u>MSDC_CFG</u>	32	SD memory card controller configuration register For general configuration of the SD controller. <i>Note: MSDC_CFG[31:16] can be accessed by 16-bit APB bus access.</i>
A0130004	<u>MSDC_STA</u>	32	SD memory card controller status register Contains the status of FIFO, interrupts and data requests.
A0130008	<u>MSDC_INT</u>	32	SD memory card controller interrupt register Contains the status of interrupts. Note that the register still shows the status of interrupt even though the interrupt is disabled, that is, register bit INTEN of register MSDC_CFG is set to 0. It implies that software interrupt can be implemented by polling register bit INT of register MSDC_STA and this register. However, if hardware interrupt is desired, be sure to clear the register before setting up register bit INTEN of register MSDC_CFG to 1, or undesired hardware interrupt arisen from the previous interrupt status may take place.
A013000C	<u>MSDC_PS</u>	32	SD memory card pin status register Used for card detection. When the memory card controller and system are powered on, the power for the memory card will still be off unless the power is supplied by the PMIC. Meanwhile, the pad for card detection defaults to pull down when the system is powered on. The scheme of card detection for MS is the same as that for SD. For detecting card insertion, first pull up the INS pin and then enable card detection and the input pin at the same time. After 32 cycles of controller clock, the status of pin changes will emerge. To detect card removal, simply keep enabling card detection and the input pin.
A0130010	<u>MSDC_DAT</u>	32	SD memory card controller data register Reads/Writes data from/to FIFO inside SD controller. Data access unit: 32 bits
A0130014	<u>MSDC_IOCON</u>	32	SD memory card controller IO control register Specifies output driving capability and slew rate of IO pads for MSDC. The reset value is suggested setting. If the output driving capability of pins DAT0, DAT1, DAT2 and DAT3 is too large, it is possible to arise ground bounce and thus result in glitch on SCLK. The actual driving current will depend on the PAD type selected for the chip.
A0130018	<u>MSDC_IOCON1</u>	32	SD memory card controller IO control register 1
A0130020	<u>SDC_CFG</u>	32	SD memory card controller configuration register Configures the SD memory card controller when it is configured as the host of SD. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the

Address	Name	Width	Register function
			controller. <i>Note: SDC_CFG[31:16] can be accessed by 16-bit APB bus access.</i>
A0130024	<u>SDC_CMD</u>	32	SD memory card controller command register Defines a SD memory card command and its attribute. Before the SD controller issues a transaction onto the SD bus, application shall specify other relative settings such as argument for command. After application writes the register, the SD controller will issue the corresponding transaction onto SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD bus run 128 cycles before issuing the command.
A0130028	<u>SDC_ARG</u>	32	SD memory card controller argument register Contains argument of the SD memory card command.
A013002C	<u>SDC_STA</u>	32	SD memory card controller status register Contains various statuses of SD controller as the controller is configured as the host of SD memory card.
A0130030	<u>SDC_RESP0</u>	32	SD memory card controller response register 0 Contains parts of the last SD memory card bus response. See descriptions of register field SDC_RESP3.
A0130034	<u>SDC_RESP1</u>	32	SD memory card controller response register 1 Contains parts of the last SD memory card bus response. See descriptions of register field SDC_RESP3.
A0130038	<u>SDC_RESP2</u>	32	SD memory card controller response register 2 Contains parts of the last SD memory card bus response. See descriptions of register field SDC_RESP3.
A013003C	<u>SDC_RESP3</u>	32	SD memory card controller response register 3 Contains parts of the last SD memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 compose the last SD memory card bus response. For response of type R2, that is, response of the command ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of the response token are stored in register field SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. For responses of other types, only bit 39 to 8 of the response token are stored in register field SDC_RESP0.
A0130040	<u>SDC_CMDSTA</u>	32	SD memory card controller command status register Contains the status of SD controller during command execution and that of SD bus protocol after command execution when the SD controller is configured as the host of SD memory card. The register will also be used as the interrupt source. The register is cleared when

Address	Name	Width	Register function
			being read. Meanwhile, if interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.
A0130044	<u>SDC_DATSTA</u>	32	SD memory card controller data status register Contains the status of SD controller during data transfer on DAT line(s) when the SD controller is configured as the host of SD memory card. The register is also used as the interrupt source. The register is cleared when being read. Meanwhile, if interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.
A0130048	<u>SDC_CSTA</u>	32	SD memory card status register After commands with R1 and R1b response this register containing the status of the SD card, it will be used as the response interrupt source. In all register fields, logic high indicates error, and logic low indicates there is no error. The register is cleared when being read. Meanwhile, if interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.
A013004C	<u>SDC_IRQMASK0</u>	32	SD memory card IRQ mask register 0 Contains parts of SD memory card interrupt mask register. See the descriptions of register SDC_IRQMASK1 for reference. The register masks interrupt sources from register SDC_CMDSTA and SDC_DATSTA. IRQMASK[3:0] is for SDC_CMDSTA, and IRQMASK[18:16] for SDC_DATSTA. Note that IRQMASK[18] masks SDC_DATSTA[9:2] together. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[0] is 1, then the interrupt source from register field CMDRDY of register SDC_CMDSTA will be masked. '0' in some bits does not cause interrupt mask on the corresponding interrupt source from register SDC_CMDSTA and SDC_DATSTA.
A0130050	<u>SDC_IRQMASK1</u>	32	SD memory card IRQ mask register 1 Contains parts of SD memory card interrupt mask register. Registers SDC_IRQMASK1 and SDC_IRQMASK0 compose the SD memory card interrupt mask register. The register masks interrupt sources from register SDC_CSTA. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[63] is 1, then interrupt source from register field OUT_OF_RANGE of register SDC_CSTA will be masked. '0' in some bit does not cause interrupt mask on the corresponding interrupt source from register SDC_CSTA.
A0130054	<u>SDIO_CFG</u>	32	SDIO configuration register Configures functions for SDIO.

Address	Name	Width	Register function
A0130058	SDIO_STA	32	SDIO status register Identifies if there is SDIO interrupt during the interrupt period on data line.
A0130080	CLK_RED	32	CLK latch configuration register Configures the MSDC sample data/response clock. <i>Note: When MSDC_IOCON[19] = 1, the host will latch response; otherwise MSDC FSM will handle the response from PAD directly.</i>
A0130098	DAT_CHECKSUM	32	MSDC Rx data checksum register Computes the checksum value of Rx read data

A0130000 MSDC_CFG SD Memory Card Controller Configuration Register 04000020

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name					FIFOTHD						VDDPD	RCDE	DIRQE	PINEN	DMAE	INTEN

Overview: For general configuration of the SD controller. Note that MSDC_CFG[31:16] can be accessed by 16-bit APB bus access.

Bit(s)	Mnemonic	Name	Description
27:24	FIFOTHD	FIFOTHD	FIFO threshold The register field determines when to issue a DMA request. For write transactions, DMA requests will be asserted if the number of free entries in FIFO are bigger than or equal to the value in the register field. For read transactions, DMA requests will be asserted if the number of valid entries in FIFO are bigger than or equal to the value in the register field. The register field must be set according to the setting of data transfer count in DMA burst mode. If single mode for DMA transfer is used, the register field shall be set to 0b0001. 0000: Invalid 0001: Threshold value is 1. 0010: Threshold value is 2. 0011~0111: ... 1000: Threshold value is 8. Others: Invalid
21	VDDPD	VDDPD	Controls output pin VDDPD used for power saving Output pin VDDPD controls the power for memory card. 0: Output pin VDDPD outputs logic low. The power for memory card will be turned off. 1: Output pin VDDPD outputs logic high. The power for memory card will be turned on.
20	RCDEN	RCDEN	Controls output pin RCDEN used for card identification process when the controller is for SD memory card Its output controls the pull-down resistor on the system board to

Bit(s)	Mnemonic	Name	Description																								
			connect to or disconnect from signal CD/DAT3. 0: The output pin RCDEN outputs logic low. 1: The output pin RCDEN outputs logic high.																								
19	DIRQEN	DIRQEN	Enables data request interrupt The register bit is used to control if data request is used as an interrupt source. 0: Data request is not used as an interrupt source. 1: Data request is used as an interrupt source.																								
18	PINEN	PINEN	Enables pin interrupt The register bit is used to control if the pin for card detection is used as an interrupt source. 0: The pin for card detection is not used as an interrupt source. 1: The pin for card detection is used as an interrupt source.																								
17	DMAEN	DMAEN	Enables DMA <i>Note: If DMA capability is disabled, the application software must poll the status of register MSDC_STA to check on any data transfer request. If DMA is desired, the register bit must be set up before command register is written.</i> 0: DMA request induced by various conditions is disabled, no matter the controller is configured as the host of either SD memory card or memory stick. 1: DMA request induced by various conditions is enabled, no matter the controller is configured as the host of either SD memory card or memory stick.																								
16	INTEN	INTEN	Enables interrupt <i>Note: If interrupt capability is disabled, the application software must poll the status of register MSDC_STA to check on any interrupt request.</i> 0: Interrupt induced by various conditions is disabled, no matter the controller is configured as the host of either SD memory card or memory stick. 1: Interrupt induced by various conditions is enabled, no matter the controller is configured as the host of either SD memory card or memory stick.																								
15:8	SCLKF	SCLKF	Controls clock frequency of serial clock on SD bus and denotes clock frequency of SD bus serial clock as fslave and clock frequency of the SD controller as fhost which is 98.3 or 96.2 MHz <i>Note: The allowed maximum frequency of fslave is 49.15MHz.</i> While changing the clock rate, "1T clock period before change + 1T clock period after change" is required for HW signal to re-synchronize. <table> <tr> <td>00000000b:</td><td>fslave</td><td>=</td><td>$=(1/2)*f_{host}$</td></tr> <tr> <td>00000001b:</td><td>fslave</td><td>=</td><td>$[1/(4*1)]*f_{host}$</td></tr> <tr> <td>00000010b:</td><td>fslave</td><td>=</td><td>$[1/(4*2)]*f_{host}$</td></tr> <tr> <td>00000011b:</td><td>fslave</td><td>=</td><td>$[1/(4*3)]*f_{host}$</td></tr> <tr> <td>00000100b~11111110b:</td><td></td><td></td><td>...</td></tr> <tr> <td>11111111b:</td><td>fslave</td><td>=</td><td>$[1/(4*255)]*f_{host}$</td></tr> </table>	00000000b:	fslave	=	$=(1/2)*f_{host}$	00000001b:	fslave	=	$[1/(4*1)]*f_{host}$	00000010b:	fslave	=	$[1/(4*2)]*f_{host}$	00000011b:	fslave	=	$[1/(4*3)]*f_{host}$	00000100b~11111110b:			...	11111111b:	fslave	=	$[1/(4*255)]*f_{host}$
00000000b:	fslave	=	$=(1/2)*f_{host}$																								
00000001b:	fslave	=	$[1/(4*1)]*f_{host}$																								
00000010b:	fslave	=	$[1/(4*2)]*f_{host}$																								
00000011b:	fslave	=	$[1/(4*3)]*f_{host}$																								
00000100b~11111110b:			...																								
11111111b:	fslave	=	$[1/(4*255)]*f_{host}$																								
7	SCLKON	SCLKON	Serial clock always on For debugging. 0: Serial clock not always on 1: Serial clock always on																								
6	CRED	CRED	Rising edge data The register bit is used to determine the serial data input is latched at the falling edge or rising edge of the serial clock. The default																								

Bit(s)	Mnemonic	Name	Description
5	STDBY	STDBY	setting is at the rising edge. If the serial data have bad timing, set the register bit to 1. When the memory card has bad timing on returned read data, set the register bit to 1. 0: Serial data input is latched at the rising edge of serial clock. 1: Serial data input is latched at the falling edge of serial clock. Standby mode If the module is powered down, operating clock to the module will be stopped. At the same time, the clock to card detection circuitry will also be stopped. If detection on memory card insertion and removal is desired, write 1 to the register bit. If interrupt for detection on memory card insertion and removal is enabled, the interrupt will take place whenever the memory is inserted or removed. 0: Standby mode is disabled. 1: Standby mode is enabled.
4:3	CLKSRC	CLKSRC	Specifies which clock is used as source clock of memory card 00 : MPLL/5.5MHz clock 01 : MPLL/7MHz dock (this divider is default off, before switch controller source clock to this clock, you should switch controller source clock to 26Mhz first, and then enable divider MPLL/7, after a moment you can switch controller source clock to MPLL/7 to void source clock glitch. For detail setting please refer to configs document) 10 : MPLL/8MHz dock 11 : MPLL/10MHz dock For phone app. 00 : 94.5MHz dock Need to keep BT_APP_DIV_EN= 1'b0 in CLK_CONDA[15]. 01 : 74.3MHz dock NOTE: Need to set POWERFUL_DIV_EN1 = 1'b1 first in CLK_CONDA[10]. 10 : 65MHz dock 11 : Forbidden For BT app. 00 : Forbidden 01 : 89.1MHz dock NOTE: Need to set POWERFUL_DIV_EN1 = 1'b1 first in CLK_CONDA[10]. 10 : 78MHz dock 11 : 62.4MHz clock NOTE: Need to set POWERFUL_DIV_EN2 = 1'b1 first in CLK_CONDA[9].
2	NOCRC	NOCRC	Disable CRC '1' indicates data transfer without CRC is desired. For write data block, the data are transmitted without CRC. For read data block, CRC will not be checked. For testing purpose. 0: Data transfer with CRC is desired. 1: Data transfer without CRC is desired.
1	RST	RST	Software reset Writing 1 to the register bit will cause internal synchronous reset of SD controller but will not reset register settings, RST should only be set when RST equal to 0. 0: Read 0 stands for the reset process is finished. 1: Write 1 to reset SD controller.
0	MSDC	MSDC	Configures the controller as SD memory card mode CLK/CMD/DAT line is pulled low when SD memory card mode is disable. 0: Disable SD memory card 1: Enable SD memory card

A0130004 MSDC_STA SD Memory Card Controller Status Register

00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	BUSY	FIFOCLR							FIFOCNT				INT	DRQ	BE	BF
Type	R	W1C							RO				RO	RO	RO	RO
Reset	0	0							0	0	0	0	0	0	0	0

Overview: The register contains the status of FIFO, interrupts and data requests.

Bit(s)	Mnemonic	Name	Description
15	BUSY	BUSY	Status of the controller If the controller is in busy state, the register bit will be 1; otherwise 0. 0: The controller is in busy state. 1: The controller is in idle state.
14	FIFOCLR	FIFOCLR	Clears FIFO Writing 1 to the register bit will cause the content of FIFO clear and reset the status of FIFO controller. 0: Read 0 stands for the FIFO clear process is finished. 1: Write 1 to clear the content of FIFO clear and reset the status of FIFO controller.
7:4	FIFOCNT	FIFOCNT	FIFO count The register field shows how many valid entries are there in FIFO. 0000: 0 valid entry in FIFO 0001: 1 valid entry in FIFO 0010: 2 valid entries in FIFO 0011~0111: ... 1000: 8 valid entries in FIFO
3	INT	INT	Indicates if there is any interrupt existing When there is interrupt existing, the register bit will still be active even if register bit INTEN in register MSDC_CFG is disabled. The SD controller can interrupt MCU by issuing interrupt request to the interrupt controller, or the software/application will poll the register endlessly to check if there is any interrupt request existing in the SD controller. When register bit INTEN in register MSDC_CFG is disabled, the second method is used. For read commands, it is possible that time-out error takes place. The software can read the status register to check if the time-out error takes place without OS time tick support or data request asserted. <i>Note: The register bit will be cleared when register MSDC_INT is read.</i> 0: No interrupt request existing. 1: Interrupt request exists.
2	DRQ	DRQ	Indicates if any data transfer is required When a data transfer is required, the register bit will still be active even if register bit DIRQEN in register MSDC_CFG is disabled. Data transfer can be achieved by DMA channel alleviating MCU loading, or by polling the register bit to check if any data transfer is requested. When register bit DIRQEN in register MSDC_CFG is disabled, the second method is used. 0: No DMA request existing. 1: DMA request exists.
1	BE	BE	Indicates if FIFO in SD controller is empty 0: FIFO in SD controller is not empty.

Bit(s)	Mnemonic	Name	Description
0	BF	BF	1: FIFO in SD controller is empty. Indicates if FIFO in SD controller is full 0: FIFO in SD controller is not full. 1: FIFO in SD controller is full.

A0130008 MSDC_INT SD Memory Card Controller Interrupt Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SDIOIRQ	SDR1BIRQ		SDMCIRQ	SDDAIRQ	SDCMIRQ	PINIRQ	DIRQ
Type									RC	RC		RC	RC	RC	RC	RC
Reset									0	0		0	0	0	0	0

Overview: The register contains the status of interrupts. Note that the register still show status of interrupt even though interrupt is disabled, that is, register bit INTEN of register MSDC_CFG is set to 0. It implies that software interrupt can be implemented by polling register bit INT of register MSDC_STA and this register. However, if hardware interrupt is desired, be sure to clear the register before setting register bit INTEN of register MSDC_CFG to 1, or undesired hardware interrupt arisen from the previous interrupt status may take place.

Bit(s)	Mnemonic	Name	Description
7	SDIOIRQ	SDIOIRQ	SDIO interrupt The register bit indicates if there is any interrupt for SDIO existing. Whenever an interrupt for SDIO exists, the register bit will be set to 1 if the interrupt is enabled. It will be reset when the register is read. 0: No SDIO interrupt 1: Interrupt for SDIO exists.
6	SDR1BIRQ	SDR1BIRQ	SD R1b response interrupt The register bit will be active when a SD command with R1b response is finished and the DAT0 line is transited from busy to idle state. Single block write commands with R1b response will cause interrupt when the command is completed either successfully or with CRC error. However, multi-block write commands with R1b response do not cause interrupt because multi-block write commands are always stopped by STOP_TRANS commands. STOP_TRANS commands (with R1b response) behind multi-block write commands will cause interrupt. Single block read command with R1b response will cause interrupt when the command is completed, but multi-block read commands do not. <i>Note: STOP_TRANS commands (with R1b response) behind multi-block read commands will cause interrupt.</i> 0: No interrupt for SD R1b response. 1: Interrupt for SD R1b response exists.
4	SDMCIRQ	SDMCIRQ	SD memory card interrupt The register bit indicates if there is any interrupt for SD memory card existing. Whenever an interrupt for SD memory card exists, i.e. any bit in register SDC_CSTA is active, the register bit will be set to 1 if interrupt is enabled. It will be reset when the register is read. <i>Note: This bit will not trigger MSDC hardware interrupt.</i> 0: No SD memory card interrupt

Bit(s)	Mnemonic	Name	Description
3	SDDATIRQ	SDDATIRQ	1: SD memory card interrupt exists. SD bus DAT interrupt The register bit indicates if there is any interrupt for SD DAT line existing. Whenever interrupt for SD DAT line exists, i.e. any bit in register SDC_DATSTA is active, the register bit will be set to 1 if interrupt is enabled. It will be reset when the register is read. 0: No SD DAT line interrupt 1: SD DAT line interrupt exists.
2	SDCMDIRQ	SDCMDIRQ	SD bus CMD interrupt The register bit indicates if there is any interrupt for SD CMD line existing. Whenever interrupt for SD CMD line exists, i.e. any bit in the register SDC_CMDSTA is active, the register bit will be set to 1 if interrupt is enabled. It will be reset when the register is read. 0: No SD CMD line interrupt 1: SD CMD line interrupt exists.
1	PINIRQ	PINIRQ	Pin change interrupt The register bit indicates if there is any interrupt for memory card insertion/removal existing. Whenever the memory card is inserted or removed and card detection interrupt is enabled, i.e. register bit PINEN in register MSDC_CFG is set to 1, the register bit will be set to 1. It will be reset when the register is read. 0: Otherwise 1: Card is inserted or removed.
0	DIRQ	DIRQ	Data request interrupt The register bit indicates if there is any interrupt for data request existing. Whenever data request exists and data request as an interrupt source is enabled, i.e. register bit DIRQEN in register MSDC_CFG is set to 1, the register bit will be active. It will be reset when being read. For software, data requests can be recognized by polling register bit DRQ or by data request interrupt. Data request interrupts will be generated every FIFOTHD data transfers. 0: No data request interrupt 1: Data request interrupt occurs.

A013000C **MSDC PS** SD Memory Card Pin Status Register 00000008

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name								CMD	DAT							
Type								RO	RO							
Reset								0	0	0	0	0	0	2	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CDDEBOUNCE											PINCH G	PIN0	POEN 0	PIEN0	CDEN
Type	RW											RC	RO	RW	RW	RW
Reset	0	0	0	0								0	1	0	0	0

Overview: The register is used for card detection. When the memory card controller and system are powered on, the power for the memory card will still be off unless the power is supplied by the PMIC. Meanwhile, the pad for card detection defaults to pull-down when the system is powered on. The scheme of card detection for MS is the same as that for SD. To detect card insertion, first pull up the INS pin and then enable card detection and the input pin at the same time. After 32 cycles of controller clock, the status of pin changes will emerge. To detect card removal, simply keep enabling card detection and the input pin.

Bit(s)	Mnemonic	Name	Description
24	CMD	CMD	Memory card/SDIO card/MMC card command lines
23:16	DAT	DAT	Memory card/SDIO card/MMC card data lines
15:12	CDDEBOUNCE	CDDEBOUNCE	Specifies the time interval for card detection de-bounce Default value: 0. It means the de-bounce interval is 32-cycle time at 32kHz. The interval can extend one cycle time at 32kHz by increasing the counter by 1.
4	PINCHG	PINCHG	Pin change The register bit indicates the status of card insertion/removal. If the memory card is inserted or removed, the register bit will be set to 1 no matter pin change interrupt is enabled or not. It will be cleared when the register is read. 0: Otherwise 1: Card is inserted or removed.
3	PINO	PINO	Shows the value of input pin for card detection 0: The value of input pin for card detection is logic low. 1: The value of input pin for card detection is logic high.
2	POEN0	POEN0	Controls output of input pin for card detection 0: Output of input pin for card detection is disabled. 1: Output of input pin for card detection is enabled.
1	PIEN0	PIEN0	Controls input pin for card detection 0: Input pin for card detection is disabled. 1: Input pin for card detection is enabled.
0	CDEN	CDEN	Enables card detection The register bit is used to enable or disable card detection. 0: Card detection is disabled. 1: Card detection is enabled.

A0130010 MSDC_DAT SD Memory Card Controller Data Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	DATA[31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DATA[15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register is used to read/write data from/to FIFO inside the SD controller. Data access unit: 32 bits.

Bit(s)	Mnemonic	Name	Description
31:0	DATA	DATA	Reads/Writes data from/to FIFO inside SD controller Data access unit: 32 bits

A0130014 MSDC_IOCON SD Memory Card Controller IO Control Register 010000C3

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name							SAMPLEDLY	FIXDLY	SAMPON	CRCDIS	CMDS	INTLH	DSW			
Type							RW	RW	RW	RW	RW	RW	RW			

Reset							0	1	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CMDRE					HIGH SPEED D	DMABURST	SRCFG1	SRCFG0		ODCCFG1			ODCCFG0		
Type	RW					RW	RW	RW	RW		RW			RW		
Reset	0					0	0	0	1	1	0	0	0	0	1	1

Overview: The register specifies the output driving capability and slew rate of IO pads for MSDC. The reset value is suggested setting. If the output driving capability of pins DAT0, DAT1, DAT2 and DAT3 is too large, it is possible to arise ground bounce and thus result in glitch on SCLK. The actual driving current depends on the PAD type selected for the chip.

Bit(s)	Mnemonic	Name	Description
25:24	SAMPLEDL Y	SAMPLEDLY	Used for SW to select the turn-around delay cycle between write data end bit and CRC status for SD card 00: 0-T delay 01: 1-T delay 10: 2-T delay 11: 3-T delay
23:22	FIXDLY	FIXDLY	Used for SW to select the delay cycle after clock fix high for the host controller to SD card 00: 0-T delay 01: 1-T delay 10: 2-T delay 11: 3-T delay
21	SAMPON	SAMPON	Data sample enabling always on The bit is suggested to be set to 1 when the feedback clock is used and to 0 when the multiple phase clock is used. 0: Data sample enabling not always on 1: Data sample enabling always on
20	CRCDIS	CRCDIS	Switches off data CRC check for SD read data 0: CRC check is on. 1: CRC check is off.
19	CMDSEL	CMDSEL	Determines whether the host should delay 1-T to latch response from card 0: Host latches response without 1-T delay 1: Host latches response with 1-T delay.
18:17	INTLH	INTLH	Selects latch timing for SDIO multi-block read interrupt 00: Host latches INT at the second backend clock after the end bit of the current data block from card is received. (Default) 01: Host latches INT at the first backend clock after the end bit of the current data block from card is received. 10: Host latches INT at the second backend clock after the end bit of the current data block from card is received. 11: Host latches INT at the third backend clock after the end bit of the current data block from card is received.
16	DSW	DSW	Determines whether the host should latch data with 1-T delay or not For SD card, this bit is suggested to be 0. For MSPRO cards, it is suggested to be 1. 0: Host latches the data with 1-T delay. 1: Host latches the data without 1-T delay.
15	CMDRE	CMDRE	Determines whether the host should latch response token (sent from card on CMD line) at rising edge or falling edge of serial

Bit(s)	Mnemonic	Name	Description
			clock (T.B.D this bit is un-useful) 0: Host latches response at rising edge of serial clock. 1: Host latches response at falling edge of serial clock.
10	HIGH_SPEE D	HIGH_SPEED	For high-speed mode when internal sample clock is used High-speed mode means the SD/MMC serial bus clock rate is bigger than 25MHz. The default speed mode means that the SD/MMC serial bus clock rate is bigger than 25MHz. 0: Default speed 1: High speed
9:8	DMABURST	DMABURST	Used for SW to select burst type when data are transferred by DMA <i>Note: Only single mode can support non-4N bytes data transfer in read operation.</i> 00: Single mode 01: 4-beat incrementing burst 10: 8-beat incrementing burst 11: Reserved
7	SRCFG1	SRCFG1	Output driving capability for pins DAT0, DAT1, DAT2 and DAT3 0: Fast slew rate 1: Slow slew rate
6	SRCFG0	SRCFG0	Output driving capability for pins CMD/BS and SCLK 0: Fast slew rate 1: Slow slew rate
5:3	ODCCFG1	ODCCFG1	Output driving capability for pins DAT0, DAT1, DAT2 and DAT3 000: 4mA 001: 8mA 010: 12mA 011: 16mA
2:0	ODCCFG0	ODCCFG0	Output driving capability for pins CMD/BS and SCLK 000: 4mA 001: 8mA 010: 12mA 011: 16mA

A0130018 MSDC IOCON1 SD Memory Card Controller IO Control Register 1 00022022

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type

Reset		0	1	0		0	0	0		0	1	0				

Bit(s)	Mnemonic	Name	Description
14	PRCFG_CK	PRCFG_CK	Pull-up/down register configuration for pin CK Default value: 0 0: Pull-up resistor in the I/O pad of pin CK is enabled. 1: Pull-down resistor in the I/O pad of pin CK is enabled.

Bit(s)	Mnemonic	Name	Description
13:12	PRVAL_CK	PRVAL_CK	Pull-up/down register value for pin CLK Default value: 10 00: Pull-up/down resistor in the I/O pad of pin CLK are all disabled. 01: Pull-up/down resistor in the I/O pad of pin CLK value is 47k. 10: Pull-up/down resistor in the I/O pad of pin CLK value is 47k. 11: Pull-up/down resistor in the I/O pad of pin CLK value is 23.5k.
10	PRCFG_CM	PRCFG_CM	Pull-up/down register configuration for pin CM Default value is 0. 0: Pull-up resistor in the I/O pad of pin CM is enabled. 1: Pull-down resistor in the I/O pad of pin CM is enabled.
9:8	PRVAL_CM	PRVAL_CM	Pull-up/down register value for pin CMD/BS Default value: 00 00: Pull-up/down resistor in the I/O pad of pin CMD/BS are all disabled. 01: Pull-up/down resistor in the I/O pad of pin CMD/BS value is 47k. 10: Pull-up/down resistor in the I/O pad of pin CMD/BS value is 47k. 11: Pull-up/down resistor in the I/O pad of pin CMD/BS value is 23.5k.
6	PRCFG_DA	PRCFG_DA	Pull-up/down register configuration for pin DAT0, DAT1, DAT2 and DAT3 Default value: 0 0: Pull-up resistor in the I/O pad of pin DAT is enabled. 1: Pull-down resistor in the I/O pad of pin DAT is enabled.
5:4	PRVAL_DA	PRVAL_DA	Pull-up/down register value for pin DAT0, DAT1, DAT2 and DAT3 Default value: 10 00: Pull-up/down resistor in the I/O pad of pin DAT are all disabled. 01: Pull-up/down resistor in the I/O pad of pin DAT value is 47k. 10: Pull-up/down resistor in the I/O pad of pin DAT value is 47k. 11: Pull-up/down resistor in the I/O pad of pin DAT value is 23.5k.

A0130020 SDC_CFG SD Memory Card Controller Configuration Register 00008000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	DTC								WDOD				SDIO		MDLE N	SIEN
Type	RW								RW				RW		RW	RW
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0		0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	BSYDLY				BLKLEN											
Type	RW				RW											
Reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register is used to configure the SD memory card controller when it is configured as the host of SD. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the controller. Note that SDC_CFG[31:16] can be accessed by 16-bit APB bus access.

Bit(s)	Mnemonic	Name	Description
31:24	DTC	DTC	Data time-out counter The period from finish of the initial host read command or the last read data block in a multiple block read operation to the start bit of the next read data block requires at least two serial clock cycles. The counter is used to extend the period (Read Data Access Time) in unit

Bit(s)	Mnemonic	Name	Description
			of 65,536 serial clock. See the register field descriptions of register bit RDINT for reference. 00000000: Extend 65,536 more serial clock cycles 00000001: Extend 65,536x2 more serial clock cycles 00000010: Extend 65,536x3 more serial clock cycles 00000011~11111110: ... 11111111: Extend 65,536x 256 more serial clock cycles
23:20	WDOD	WDOD	Write data output delay The period from finish of the response for the initial host write command or the last write data block in a multiple block write operation to the start bit of the next write data block requires at least two serial clock cycles. The register field is used to extend the period (Write Data Output Delay) in unit of one serial clock. 0000: No extension 0001: Extend 1 more serial clock cycle 0010: Extend 2 more serial clock cycles 0011~1110: ... 1111: Extend 15 more serial clock cycle
19	SDIO	SDIO	Enables SDIO 0: Disable SDIO mode 1: Enable SDIO mode
17	MDLEN	MDLEN	Enables multiple data line The register can be enabled only when SD memory card is applied and detected by software application. It is the responsibility of the application to program the bit correctly when an multi-media card is applied. If an multi-media card is applied and 4-bit data line is enabled, the 4 bits will be output every serial clock. Therefore, data integrity will fail. 0: Disable 4-bit data line 1: Enable 4-bit data line
16	SIEN	SIEN	Enables serial interface It should be enabled as soon as possible before any command. 0: Disable serial interface for SD 1: Enable serial interface for SD
15:12	BSYDLY	BSYDLY	Only valid for the commands with R1b response If the command has a response of R1b type, the SD controller must monitor the data line 0 for card busy status from the bit time that is two serial clock cycles after the command end bit to check if the operation in SD memory card have finished. The register field is used to expand the time between the command end bit and end of detection period to detect card busy status. If time is up and there is no card busy status on data line 0, the controller will abandon the detection. 0000: No extension 0001: Extend 1 more serial clock cycle 0010: Extend 2 more serial clock cycles 0011~1110: ... 1111: Extend 15 more serial clock cycle
11:0	BLKLEN	BLKLEN	Block length The register field is used to define the length of one block in unit of byte in a data transaction. The maximum value of block length is 2,048 bytes. 000000000000: Reserved 000000000001: Block length is 1 byte. 000000000010: Block length is 2 bytes.

Bit(s)	Mnemonic	Name	Description
			000000000011~011111111110: ...
			011111111111: Block length is 2,047 bytes.
			100000000000: Block length is 2,048 bytes.

A0130024 SDC_CMD SD Memory Card Controller Command Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																CMDFAIL
Type																RW
Reset																0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	INTC	STOP	RW	DTYPE	IDRT					BREAK						
Type	RW	RW	RW	RW	RW					RW						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register defines a SD memory card command and its attribute. Before the SD controller issues a transaction onto the SD bus, application shall specify other relative settings such as argument for command. After application writes the register, the SD controller will issue the corresponding transaction onto the SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD bus run 128 cycles before issuing the command.

Bit(s)	Mnemonic	Name	Description
16	CMDFAIL	CMDFAIL	If 4-bit SDIO mode is enabled and when CMD/DAT error occurs, set this bit to select whether to "wait stop command" or "wait data state machine idle". 0: Wait stop command 1: Wait data state machine idle
15	INTC	INTC	Indicates if the command is GO_IRQ_STATE If the command is GO_IRQ_STATE, the period between command token and response token will not be limited. 0: The command is not GO_IRQ_STATE. 1: The command is GO_IRQ_STATE
14	STOP	STOP	Indicates if the command is a stop transmission command 0: The command is not a stop transmission command. 1: The command is a stop transmission command.
13	RW	RW	Defines the command is a read command or write command The register bit is valid only when the command causes a transaction with data token. 0: The command is a read command. 1: The command is a write command.
12:11	DTYPE	DTYPE	Defines data token type for the command 00: No data token for the command 01: Single block transaction 10: Multiple block transaction, i.e. the command is a multiple block read or write command. 11: Stream operation. It can only be used when an multi-media card is applied.
10	IDRT	IDRT	Identification response time The register bit indicates if the command has a response with NID (i.e. 5 serial clock cycles as defined in SD Memory Card

Bit(s)	Mnemonic	Name	Description
9:7	RSPTYP	RSPTYP	Specification Part 1 Physical Layer Specification version 1.0) response time. The register bit is valid only when the command has a response token. Thus the register bit must be set to 1 for CMD2 (ALL_SEND_CID) and ACMD41 (SD_APP_OP_CMD). 0: Otherwise 1: The command has a response with NID response time. Defines response type for the command For commands with R1 and R1b response, register SDC_CSTA (not SDC_STA) updates after response token is received. This register SDC_CSTA contains the status of the SD, and it can be used as a response interrupt source. <i>Note: If CMD7 is used with all 0's RCA, then RSPTYP must be "000". Command "GO_TO_IDLE" also has RSPTYP="000".</i> 000: There is no response for the command, e.g. broadcast command without response and GO_INACTIVE_STATE command. 001: The command has R1 response. R1 response token is 48-bit. 010: The command has R2 response. R2 response token is 136-bit. 011: The command has R3 response. Even though R3 is 48-bit response, it does not contain CRC checksum. 100: The command has R4 response. R4 response token is 48-bit. (only for MMC) 101: The command has R5 response. R5 response token is 48-bit. (only for MMC) 110: The command has R6 response. R6 response token is 48-bit. 111: The command has R1b response. If the command has a response of R1b type, SD controller must monitor the data line 0 for card busy status from the bit time that is 2 or 4 serial clock cycles after the command end bit to check if the operation in SD memory card has finished. There are two cases for detection of card busy status. The first case is that the host stops the data transmission during an active write data transfer. The card will assert busy signal after the stop transmission command end bit followed by 4 serial clock cycles. The second case is that the card is in idle state or receiving a stop transmission command between data blocks when multiple block write command is in progress. The register bit will be valid only when the command has a response token.
6	BREAK	BREAK	Aborts pending MMC GO_IRQ_MODE command It is only valid for a pending GO_IRQ_MODE command waiting for MMC interrupt response. 0: Other fields are valid. 1: Break a pending MMC GO_IRQ_MODE command in the controller. Other fields are invalid.
5:0	CMD	CMD	SD memory card command Total 6 bits.

A0130028	<u>SDC_ARG</u>		SD Memory Card Controller Argument Register												00000000	
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	ARG[31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	ARG[15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register contains the argument of the SD memory card command.

Bit(s)	Mnemonic	Name	Description
31:0	ARG	ARG	Contains argument of the SD memory card command.

A013002C SDC_STA SD Memory Card Controller Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	WP											FEDATBUS Y	FECMDBUS Y	BEDATBUS Y	BECMDBUS Y	BESDCBUS Y
Type	RO											RO	RO	RO	RO	RO
Reset	0											0	0	0	0	0

Overview: The register contains various statuses of SD controller as the controller is configured as the host of SD memory card.

Bit(s)	Mnemonic	Name	Description
15	WP	WP	Detects the status of write protection switch on SD memory card The register bit shows the status of write protection switch on SD memory card. There is no default reset value. Pin WP (Write Protection) is only useful when the controller is configured for SD memory card. 1: Write protection switch on, i.e. memory card is desired to be write-protected. 0: Write protection switch off, i.e. memory card is writable.
4	FEDATBUS Y	FEDATBUSY	Indicates if there is any transmission going on DAT line on SD bus This bit indicates directly the CMD line at card clock domain. For those commands without data but still involving DAT line, the register bit is useless. For example, if an erase command is issued, checking if the register bit is 0 before issuing the next command with data will not guarantee that the controller is idle. In this case, use register bit BESDCBUSY. 0: No transmission is going on DAT line on SD bus. 1: There is transmission going on DAT line on SD bus.
3	FECMDBUS Y	FECMDBUSY	Indicates if there is any transmission going on CMD line on SD bus This bit indicates directly the CMD line at card clock domain. 0: No transmission is going on CMD line on SD bus. 1: There is transmission going on CMD line on SD bus.
2	BEDATBUS Y	BEDATBUSY	Indicates if there is any transmission going on DAT line on SD bus 0: Backend SDC controller gets the info that no transmission is going on DAT line on SD bus. 1: Backend SDC controller gets the info that there is transmission going on DAT line on SD bus.
1	BECMDBUS	BECMDBUSY	Indicates if there is any transmission going on CMD line on SD bus

Bit(s)	Mnemonic	Name	Description
Y			bus This bit shows backend controller's CMD busy state. The busy state is synced from card clock domain to bus clock domain. 0: Backend SDC controller gets the info that no transmission is going on CMD line on SD bus. 1: Backend SDC controller gets the info that there is transmission going on CMD line on SD bus.
0	BESDCBUS	BESDCBUSY	Indicates if SD controller is busy, i.e. is there any transmission going on CMD or DAT line on SD bus This bit shows backend controller's SDC busy state. The busy state is synced from card clock domain to bus clock domain. 0: Backend SD controller is idle. 1: Backend SD controller is busy.

A0130030 SDC_RESP0 SD Memory Card Controller Response Register 0 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	RESP[31:0][31:16]

Overview: The register contains parts of the last SD memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 compose the last SD memory card bus response. For response of type R2, i.e. response of commands ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of the response token are stored in register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. For response of other types, only bit 39 to 8 of the response token are stored in register field SDC_RESP0.

Bit(s)	Mnemonic	Name	Description
31:0	RESP[127:96]	RESP_127_96	

A0130040 SDC_CMDSTA SD Memory Card Controller Command Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														RSPC RCER R	CMDT O	CMDR DY
Type														RC	RC	RC
Reset														0	0	0

Overview: The register contains the status of SD controller during command execution and that of SD bus protocol after command execution when the SD controller is configured as the host of SD memory card. The

register can also be used as an interrupt source. The register is cleared when being read. Meanwhile, if the interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.

Bit(s)	Mnemonic	Name	Description
2	RSPRCER R	RSPRCERR	CRC error on CMD detected '1' indicates the SD controller detects a CRC error after reading a response from the CMD line. 0: Otherwise 1: SD controller detects a CRC error after reading a response from the CMD line.
1	CMDTO	CMDTO	Time-out on CMD detected '1' indicates the SD controller detects a time-out condition while waiting for a response on the CMD line. 0: Otherwise 1: SD controller detects a timeout condition while waiting for a response on the CMD line.
0	CMDRDY	CMDRDY	For command without response, the register bit will be 1 once the command is completed on SD bus For command with response, the register bit will be 1 whenever the command is issued onto the SD bus and its corresponding response is received without CRC error. 0: Otherwise 1: Command with/without response is finished successfully without CRC error.

A0130044 SDC DATSTA SD Memory Card Controller Data Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name							DATCRCERR								DATT O	BLKD ONE
Type							RC								RC	RC
Reset							0	0	0	0	0	0	0	0	0	0

Overview: The register contains the status of SD controller during data transfer on DAT line(s) when the SD controller is configured as the host of SD memory card. The register can be used as an interrupt source. The register is cleared when being read. Meanwhile, if the interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.

Bit(s)	Mnemonic	Name	Description
9:2 R	DATRCER R	DATRCERR	CRC error on DAT detected '1' indicates that the SD controller detects a CRC error for bit n after reading a block of data from the DAT line or SD signals a CRC error after writing a block of data to the DAT line. 0: Otherwise 1: SD controller detects a CRC error after reading a block of data from the DAT line or SD signals a CRC error after writing a block of data to the DAT line. <i>Note: n is 7 ~ 1 for 8-bits mode. Each bit is read and cleared</i>

Bit(s)	Mnemonic	Name	Description
1	DATTO	DATTO	<i>individually.</i> Time-out on DAT detected A '1' indicates that the SD controller detects a time-out condition while waiting for data token on the DAT line. 0: Otherwise 1: SD controller detects a time-out condition while waiting for data token on the DAT line.
0	BLKDONE	BLKDONE	Indicates the status of data block transfer 0: Otherwise 1: A data block is successfully transferred.

A0130048 SDC_CSTA SD Memory Card Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	CSTA [31:0][31:16]															
Type	RC															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CSTA [31:0][15:0]															
Type	RC															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: After commands with R1 and R1b respond this register containing the status of the SD card, it will be used as a response interrupt source. In all register fields, logic high indicates error, and logic low indicates no error. The register is cleared when being read. Meanwhile, if the interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.

Bit(s)	Mnemonic	Name	Description
31:0	CSTA [31:0]	CSTA_31_0	CSTA31: OUT_OF_RANGE. The command's argument is out of the allowed range for this card. CSTA30: ADDRESS_ERROR. A misaligned address that does not match the block length is used in the command. CSTA29: BLOCK_LEN_ERROR. The transferred block length is not allowed for this card, or the number of transferred bytes does not match the block length. CSTA28: ERASE_SEQ_ERROR. An error in the sequence of erase commands occurs. CSTA27: ERASE_PARAM. An invalid selection of write-blocks for erase occurs. CSTA26: WP_VIOLATION. Attempt to program a write-protected block. CSTA25: Reserved. Return to 0. CSTA24: LOCK_UNLOCK_FAILED. Set when a sequence or password error is detected in lock/unlock card command or if there is an attempt to access a locked card. CSTA23: COM_CRC_ERROR. The CRC check of the previous command fails. CSTA22: ILLEGAL_COMMAND. Command not legal for the card state. CSTA21: CARD_ECC_FAILED. Card internal ECC is applied but fails to correct the data. CSTA20: CC_ERROR. Internal card controller error.

CSTA19: ERROR. A general or unknown error occurs during the operation.

CSTA18: UNDERRUN. The card cannot sustain data transfer in stream read mode.

CSTA17: OVERRUN. The card cannot sustain data programming in stream write mode.

CSTA16: CID/CSD_OVERWRITE. It can be either one of the following errors: 1) The CID register has been already written and cannot be overwritten; 2) The read-only section of the CSD does not match the card; 3) An attempt to reverse the copy (set as the original) or permanent WP (unprotected) bits is made.

CSTA[15: 4]: Reserved. Return to 0.

CSTA3: AKE_SEQ_ERROR. Error in the sequence of authentication process

CSTA[2: 0]: Reserved. Return to 0.

A013004C SDC_IRQMASK0 SD Memory Card IRQ Mask Register 0 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	IRQMASK [31:0][31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	IRQMASK [31:0][15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register contains parts of SD memory card interrupt mask register. See the register descriptions of register SDC_IRQMASK1 for reference. The register masks interrupt sources from register SDC_CMDSTA and SDC_DATSTA. IRQMASK[3:0] is for SDC_CMDSTA, and IRQMASK[18:16] for SDC_DATSTA. Note that IRQMASK[18] masks SDC_DATSTA[9:2] together. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[0] is 1, then the interrupt source from register field CMDRDY of register SDC_CMDSTA will be masked. '0' in some bits does not cause interrupt mask on the corresponding interrupt source from registers SDC_CMDSTA and SDC_DATSTA.

Bit(s)	Mnemonic	Name	Description
31:0	IRQMASK [31:0]	IRQMASK_31_0	

A0130050 SDC_IRQMASK1 SD Memory Card IRQ Mask Register 1 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	IRQMASK [63:32][31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	IRQMASK [63:32][15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register contains parts of SD memory card interrupt mask register. Registers SDC_IRQMASK1 and SDC_IRQMASK0 compose the SD memory card interrupt mask register. The register masks interrupt

sources from register SDC_CSTA. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[63] is 1, then the interrupt source from register field OUT_OF_RANGE of register SDC_CSTA will be masked. '0' in some bits does not cause interrupt mask on the corresponding interrupt source from register SDC_CSTA.

Bit(s)	Mnemonic	Name	Description
31:0	IRQMASK [63:32]	IRQMASK_63_32	

A0130054 SDIO_CFG SDIO Configuration Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											DISSEL		INTCSEL	DSBSEL		INTEN
Type											RW		RW	RW		RW
Reset											0		0	0		0

Overview: The register is used to configure functions for SDIO.

Bit(s)	Mnemonic	Name	Description
5	DISSEL	DISSEL	Selects data block interrupt source 0: The host detects SDIO interrupt during interrupt period between two data blocks of multiple block data access. 1: The host ignores SDIO interrupt during interrupt period between two data blocks of multiple block data access.
3	INTCSEL	INTCSEL	Selects interrupt control 0: The host detects DAT1 low as SDIO interrupt. 1: The host detects DAT3/DAT2/DAT1/DAT0 4'b1101 as SDIO interrupt.
2	DSBSEL	DSBSEL	Selects data block start bit 0: Use data line 0 as start bit of data block. Other data lines are ignored. 1: Start bit of a data block is received only when all data line 0-3 become low.
0	INTEN	INTEN	Enables interrupt for SDIO 0: Disable 1: Enable

A0130058 SDIO_STA SDIO Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																IRQ
Type																RO
Reset																0

Overview: This register is used to identify if there is SDIO interrupt during the interrupt period on data line.

Bit(s)	Mnemonic	Name	Description
0	IRQ	IRQ	SDIO interrupt exists on the data line. For example, when in the interrupt period or the 1-bit data line mode and DAT1/5 goes low from high, this bit will become 1 from 0. If DAT1/5 goes high from low, this bit will become 0 from 1. 0: There is no SDIO interrupt existing on the data line. 1: There is SDIO interrupt existing on the data line.

A0130080 CLK_RED CLK Latch Configuration Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name			CMD_RED													
Type			RW													
Reset			0													
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name			DAT_RED						CLKP_AD_R	CLK_LATCH						
Type			RW						RW	RW						
Reset			0						0	0						

Overview: The register is used to configure the MSDC sample data/response clock. Note that only when MSDC_IOC[19] = 1 will the host latch response; otherwise MSDC FSM will handle the response from PAD directly.

Bit(s)	Mnemonic	Name	Description
29	CMD_RED	CMD_RED	Determines the command response from card output is latched at falling edge or rising edge of internal clock Only effective when CLK_LATCH = 1 0: Internal clock rising edge to latch response 1: Internal clock falling edge to latch response
13	DAT_RED	DAT_RED	Determines the input data from card output is latched at falling edge or rising edge of internal sample clock Only effective when CLK_LATCH = 1 0: Internal clock rising edge to latch data 1: Internal clock falling edge to latch data
7	CLKPAD_R	CLKPAD_RED	Determines the input data from card is latched at falling edge or rising edge of the feedback clock from pad The suggested setting is 0 when SD serial clock is lower than 25MHz. The suggestion setting is 1 when SD serial clock is higher than 25MHz. The suggestion setting is 0 for MMC card no matter the serial clock rate is high speed or default speed. Only effective when CLK_LATCH = 0. 0: Internal feedback clock rising edge to latch data/response 1: Internal feedback clock falling edge to latch data/response
6	CLK_LATCH	CLK_LATCH	Determines which clock to latch data from card The suggested setting is 1 if SCLKF in register field MSDC_CFG is 0x0. Otherwise, the suggested setting is 0. 0: Internal feedback clock is used to latch data/response from card.

Bit(s)	Mnemonic	Name	Description
1: Internal clock is used to latch data/response from card.			

A0130098 DAT_CHECKSUM MSDC Rx Data Checksum Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	DAT_CHECKSUM[31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DAT_CHECKSUM[15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register is used to complete the checksum value of Rx read data

Bit(s)	Mnemonic	Name	Description
31:0	DAT_CHECKSUM	DAT_CHECKSUM	The checksum algorithm is 32-bit XOR.

3.17 SD Memory Card Controller (MSDC1)

3.17.1 Introduction

The controller fully supports the SD memory card bus protocol as defined in SD Memory Card Specification Part 1 Physical Layer Specification version 2.0.

Furthermore, the controller also partially supports the SDIO card specification version 2.0. However, the controller can only be configured as the host of the SD memory card. Hereafter, the controller is also abbreviated as the SD controller. The following are the main features of the controller.

- Interface with MCU by APB bus
- 16/32-bit access on APB bus
- 16/32-bit access for control registers
- 32-bit access for FIFO
- Built-in 32 bytes FIFO buffers for transmit and receive, FIFO is shared for transmit and receive
- Built-in CRC circuit
- CRC generation can be disabled
- DMA supported
- Interrupt capabilities
- Data rate up to 48 Mbps in serial mode, 48x4 Mbps in parallel model, the module is targeted at 48 MHz operating clock
- Serial clock rate on SD bus is programmable
- Card detection capabilities during sleep mode
- Controllability of power for memory card
- Does not support SPI mode for SD memory card

- Does not support multiple SD memory cards

3.17.2 Overview

3.17.2.1 Pin Assignment

The following lists pins required for the SD memory card. Table 51 shows how the pins are shared. Note that all I/O pads have embedded both pull-up and pull-down resistors because they are shared by the SD memory card. The pull-down resistors for these pins can be used for power saving. If optimal pull-up or pull-down resistors are required on the system board, all embedded pull-up and pull-down resistors can be disabled by programming the corresponding control registers. The VDDPD pin is used for power saving. Power for the SD memory card can be shut down by programming the corresponding control register. The WP (Write Protection) pin is used to detect the status of the Write Protection Switch on the SD memory card.

Table 51. Sharing of pins for SD memory card controller

No.	Name	Type	MMC	SD	Description
1	SD_CLK	O	CLK	CLK	Clock
2	SD_DAT3	I/O/PP		CD/DAT3	Data Line [Bit 3]
3	SD_DAT0	I/O/PP	DAT0	DAT0	Data Line [Bit 0]
4	SD_DAT1	I/O/PP		DAT1	Data Line [Bit 1]
5	SD_DAT2	I/O/PP		DAT2	Data Line [Bit 2]
6	SD_CMD	I/O/PP	CMD	CMD	Command Or Bus State
7	SD_PWRON	O			VDD ON/OFF
8	SD_WP	I			Write Protection Switch in SD
9	SD_INS	I	VSS2	VSS2	Card Detection

3.17.2.2 Card Detection

For SD memory card, detection of card insertion/removal by hardware is supported, and a dedicated pin “INS” is used to perform card insertion and removal for SD. The pin “INS” will be connected to the pin “VSS2” of a SD connector (see **Figure 45**).

Figure 46. Card detection for SD memory card

Figure 47. Card detection for SD memory card (Scheme 2)

3.17.3 Register Definition

Module name: MSDC1 base address: (+A0270000h)

Address	Name	Width	Register function
A0270000	MSDC_CFG	32	SD memory card controller configuration register For general configuration of the SD controller. Note: MSDC_CFG[31:16] can be accessed by 16-bit APB bus access.
A0270004	MSDC_STA	32	SD memory card controller status register

Address	Name	Width	Register function
			Contains the status of FIFO, interrupts and data requests.
A0270008	<u>MSDC_INT</u>	32	SD memory card controller interrupt register Contains the status of interrupts. Note that the register still shows the status of interrupt even though the interrupt is disabled, that is, register bit INTEN of register MSDC_CFG is set to 0. It implies that software interrupt can be implemented by polling register bit INT of register MSDC_STA and this register. However, if hardware interrupt is desired, be sure to clear the register before setting up register bit INTEN of register MSDC_CFG to 1, or undesired hardware interrupt arisen from the previous interrupt status may take place.
A027000C	<u>MSDC_PS</u>	32	SD memory card pin status register Used for card detection. When the memory card controller and system are powered on, the power for the memory card will still be off unless the power is supplied by the PMIC. Meanwhile, the pad for card detection defaults to pull down when the system is powered on. The scheme of card detection for MS is the same as that for SD. For detecting card insertion, first pull up the INS pin and then enable card detection and the input pin at the same time. After 32 cycles of controller clock, the status of pin changes will emerge. To detect card removal, simply keep enabling card detection and the input pin.
A0270010	<u>MSDC_DAT</u>	32	SD memory card controller data register Reads/Writes data from/to FIFO inside SD controller. Data access unit: 32 bits
A0270014	<u>MSDC_IOCON</u>	32	SD memory card controller IO control register Specifies output driving capability and slew rate of IO pads for MSDC. The reset value is suggested setting. If the output driving capability of pins DAT0, DAT1, DAT2 and DAT3 is too large, it is possible to arise ground bounce and thus result in glitch on SCLK. The actual driving current will depend on the PAD type selected for the chip.
A0270018	<u>MSDC_IOCON1</u>	32	SD memory card controller IO control register 1
A0270020	<u>SDC_CFG</u>	32	SD memory card controller configuration register Configures the SD memory card controller when it is configured as the host of SD. The register is used to configure the SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the controller. <i>Note: SDC_CFG[31:16] can be accessed by 16-bit APB bus access.</i>
A0270024	<u>SDC_CMD</u>	32	SD memory card controller command register

Address	Name	Width	Register function
			Defines a SD memory card command and its attribute. Before the SD controller issues a transaction onto the SD bus, application shall specify other relative settings such as argument for command. After application writes the register, the SD controller will issue the corresponding transaction onto SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD bus run 128 cycles before issuing the command.
A0270028	<u>SDC_ARG</u>	32	SD memory card controller argument register Contains argument of the SD memory card command.
A027002C	<u>SDC_STA</u>	32	SD memory card controller status register Contains various statuses of SD controller as the controller is configured as the host of SD memory card.
A0270030	<u>SDC_RESP0</u>	32	SD memory card controller response register 0 Contains parts of the last SD memory card bus response. See descriptions of register field SDC_RESP3.
A0270034	<u>SDC_RESP1</u>	32	SD memory card controller response register 1 Contains parts of the last SD memory card bus response. See descriptions of register field SDC_RESP3.
A0270038	<u>SDC_RESP2</u>	32	SD memory card controller response register 2 Contains parts of the last SD memory card bus response. See descriptions of register field SDC_RESP3.
A027003C	<u>SDC_RESP3</u>	32	SD memory card controller response register 3 Contains parts of the last SD memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 compose the last SD memory card bus response. For response of type R2, that is, response of the command ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of the response token are stored in register field SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. For responses of other types, only bit 39 to 8 of the response token are stored in register field SDC_RESP0.
A0270040	<u>SDC_CMDSTA</u>	32	SD memory card controller command status register Contains the status of SD controller during command execution and that of SD bus protocol after command execution when the SD controller is configured as the host of SD memory card. The register will also be used as the interrupt source. The register is cleared when being read. Meanwhile, if interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.
A0270044	<u>SDC_DATSTA</u>	32	SD memory card controller data status register Contains the status of SD controller during data

Address	Name	Width	Register function
			transfer on DAT line(s) when the SD controller is configured as the host of SD memory card. The register is also used as the interrupt source. The register is cleared when being read. Meanwhile, if interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.
A0270048	<u>SDC_CSTA</u>	32	SD memory card status register After commands with R1 and R1b response this register containing the status of the SD card, it will be used as the response interrupt source. In all register fields, logic high indicates error, and logic low indicates there is no error. The register is cleared when being read. Meanwhile, if interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.
A027004C	<u>SDC_IRQMASK0</u>	32	SD memory card IRQ mask register 0 Contains parts of SD memory card interrupt mask register. See the descriptions of register SDC_IRQMASK1 for reference. The register masks interrupt sources from register SDC_CMDSTA and SDC_DATSTA. IRQMASK[3:0] is for SDC_CMDSTA, and IRQMASK[18:16] for SDC_DATSTA. Note that IRQMASK[18] masks SDC_DATSTA[9:2] together. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[0] is 1, then the interrupt source from register field CMDRDY of register SDC_CMDSTA will be masked. '0' in some bits does not cause interrupt mask on the corresponding interrupt source from register SDC_CMDSTA and SDC_DATSTA.
A0270050	<u>SDC_IRQMASK1</u>	32	SD memory card IRQ mask register 1 Contains parts of SD memory card interrupt mask register. Registers SDC_IRQMASK1 and SDC_IRQMASK0 compose the SD memory card interrupt mask register. The register masks interrupt sources from register SDC_CSTA. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[63] is 1, then interrupt source from register field OUT_OF_RANGE of register SDC_CSTA will be masked. '0' in some bit does not cause interrupt mask on the corresponding interrupt source from register SDC_CSTA.
A0270054	<u>SDIO_CFG</u>	32	SDIO configuration register Configures functions for SDIO.
A0270058	<u>SDIO_STA</u>	32	SDIO status register Identifies if there is SDIO interrupt during the interrupt period on data line.
A0270080	<u>CLK_RED</u>	32	CLK latch configuration register Configures the MSDC sample data/response clock.

Address	Name	Width	Register function
			<i>Note: When MSDC_IOCON[19] = 1, the host will latch response; otherwise MSDC FSM will handle the response from PAD directly.</i>
A0270098	DAT_CHECKSUM	32	MSDC Rx data checksum register Completes the checksum value of Rx read data

A0270000 MSDC_CFG SD Memory Card Controller Configuration Register 04000020

Overview: For general configuration of the SD controller. Note that MSDC_CFG[31:16] can be accessed by 16-bit APB bus access.

Bit(s)	Mnemonic	Name	Description
27:24	FIFOTHD	FIFOTHD	FIFO threshold The register field determines when to issue a DMA request. For write transactions, DMA requests will be asserted if the number of free entries in FIFO are bigger than or equal to the value in the register field. For read transactions, DMA requests will be asserted if the number of valid entries in FIFO are bigger than or equal to the value in the register field. The register field must be set according to the setting of data transfer count in DMA burst mode. If single mode for DMA transfer is used, the register field shall be set to 0b0001. 0000: Invalid 0001: Threshold value is 1. 0010: Threshold value is 2. 0011~0111: ... 1000: Threshold value is 8. Others: Invalid
21	VDDPD	VDDPD	Controls output pin VDDPD used for power saving Output pin VDDPD controls the power for memory card. 0: Output pin VDDPD outputs logic low. The power for memory card will be turned off. 1: Output pin VDDPD outputs logic high. The power for memory card will be turned on.
20	RCDEN	RCDEN	Controls output pin RCDEN used for card identification process when the controller is for SD memory card Its output controls the pull-down resistor on the system board to connect to or disconnect from signal CD/DAT3. 0: The output pin RCDEN outputs logic low. 1: The output pin RCDEN outputs logic high.
19	DIRQEN	DIRQEN	Enables data request interrupt The register bit is used to control if data request is used as an

Bit(s)	Mnemonic	Name	Description
			interrupt source. 0: Data request is not used as an interrupt source. 1: Data request is used as an interrupt source.
18	PINEN	PINEN	Enables pin interrupt The register bit is used to control if the pin for card detection is used as an interrupt source. 0: The pin for card detection is not used as an interrupt source. 1: The pin for card detection is used as an interrupt source.
17	DMAEN	DMAEN	Enables DMA <i>Note: If DMA capability is disabled, the application software must poll the status of register MSDC_STA to check on any data transfer request. If DMA is desired, the register bit must be set up before command register is written.</i> 0: DMA request induced by various conditions is disabled, no matter the controller is configured as the host of either SD memory card or memory stick. 1: DMA request induced by various conditions is enabled, no matter the controller is configured as the host of either SD memory card or memory stick.
16	INTEN	INTEN	Enables interrupt <i>Note: If interrupt capability is disabled, the application software must poll the status of register MSDC_STA to check on any interrupt request.</i> 0: Interrupt induced by various conditions is disabled, no matter the controller is configured as the host of either SD memory card or memory stick. 1: Interrupt induced by various conditions is enabled, no matter the controller is configured as the host of either SD memory card or memory stick.
15:8	SCLKF	SCLKF	Controls clock frequency of serial clock on SD bus and denotes clock frequency of SD bus serial clock as fslave and clock frequency of the SD controller as fhost which is 98.3 or 96.2 MHz <i>Note: The allowed maximum frequency of fslave is 49.15MHz.</i> While changing the clock rate, "1T clock period before change + 1T clock period after change" is required for HW signal to re-synchronize. 00000000b: fslave = $(1/2) \cdot f_{host}$ 00000001b: fslave = $[1/(4 \cdot 1)] \cdot f_{host}$ 00000010b: fslave = $[1/(4 \cdot 2)] \cdot f_{host}$ 00000011b: fslave = $[1/(4 \cdot 3)] \cdot f_{host}$ 00000100b~11111110b: ... 11111111b: fslave = $[1/(4 \cdot 255)] \cdot f_{host}$
7	SCLKON	SCLKON	Serial clock always on For debugging. 0: Serial clock not always on 1: Serial clock always on
6	CRED	CRED	Rising edge data The register bit is used to determine the serial data input is latched at the falling edge or rising edge of the serial clock. The default setting is at the rising edge. If the serial data have bad timing, set the register bit to 1. When the memory card has bad timing on returned read data, set the register bit to 1. 0: Serial data input is latched at the rising edge of serial clock. 1: Serial data input is latched at the falling edge of serial clock.

Bit(s)	Mnemonic	Name	Description
5	STDBY	STDBY	Standby mode If the module is powered down, operating clock to the module will be stopped. At the same time, the clock to card detection circuitry will also be stopped. If detection on memory card insertion and removal is desired, write 1 to the register bit. If interrupt for detection on memory card insertion and removal is enabled, the interrupt will take place whenever the memory is inserted or removed. 0: Standby mode is disabled. 1: Standby mode is enabled.
4:3	CLKSRC	CLKSRC	Specifies which clock is used as source clock of memory card 00 : MPLL/5.5MHz clock 01 : MPLL/7MHz dock (this divider is default off, before switch controller source clock to this clock, you should switch controller source clock to 26MHz first, and then enable divider MPLL/7, after a moment you can switch controller source clock to MPLL/ 7 to void source clock glitch. For detail setting please refer to configs document) 10 : MPLL/8MHz dock 11 : MPLL/10MHz dock For phone 00 : 94.5MHz dock Need to keep BT_APP_DIV_EN= 1'b0 in CLK_CONDA[15]. 01 : 74.3MHz dock NOTE: Need to set POWERFUL_DIV_EN1 = 1'b1 first in CLK_CONDA[10]. 10 : 65MHz dock 11 : Forbidden For BT app. 00 : Forbidden 01 : 89.1MHz dock NOTE: Need to set POWERFUL_DIV_EN1 = 1'b1 first in CLK_CONDA[10]. 10 : 78MHz dock 11 : 62.4MHz clock NOTE: Need to set POWERFUL_DIV_EN2 = 1'b1 first in CLK_CONDA[9].
2	NOCRC	NOCRC	Disable CRC '1' indicates data transfer without CRC is desired. For write data block, the data are transmitted without CRC. For read data block, CRC will not be checked. For testing purpose. 0: Data transfer with CRC is desired. 1: Data transfer without CRC is desired.
1	RST	RST	Software reset Writing 1 to the register bit will cause internal synchronous reset of SD controller but will not reset register settings, RST should only be set when RST equal to 0. 0: Read 0 stands for the reset process is finished. 1: Write 1 to reset SD controller.
0	MSDC	MSDC	Configures the controller as SD memory card mode CLK/CMD/DAT line is pulled low when SD memory card mode is disable. 0: Disable SD memory card 1: Enable SD memory card

A0270004	<u>MSDC_STA</u>	SD Memory Card Controller Status Register												00000000		
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Name	BUSY	FIFOC LR							FIFOCNT	INT	DRQ	BE	BF
Type	R	W1C							RO	RO	RO	RO	RO
Reset	0	0							0 0 0 0	0	0	0	0

Overview: The register contains the status of FIFO, interrupts and data requests.

Bit(s)	Mnemonic	Name	Description
15	BUSY	BUSY	Status of the controller If the controller is in busy state, the register bit will be 1; otherwise 0. 0: The controller is in busy state. 1: The controller is in idle state.
14	FIFOC LR	FIFOC LR	Clears FIFO Writing 1 to the register bit will cause the content of FIFO clear and reset the status of FIFO controller. 0: Read 0 stands for the FIFO clear process is finished. 1: Write 1 to clear the content of FIFO clear and reset the status of FIFO controller.
7:4	FIFOCNT	FIFOCNT	FIFO count The register field shows how many valid entries are there in FIFO. 0000: 0 valid entry in FIFO 0001: 1 valid entry in FIFO 0010: 2 valid entries in FIFO 0011~0111: ... 1000: 8 valid entries in FIFO
3	INT	INT	Indicates if there is any interrupt existing When there is interrupt existing, the register bit will still be active even if register bit INTEN in register MSDC_CFG is disabled. The SD controller can interrupt MCU by issuing interrupt request to the interrupt controller, or the software/application will poll the register endlessly to check if there is any interrupt request existing in the SD controller. When register bit INTEN in register MSDC_CFG is disabled, the second method is used. For read commands, it is possible that time-out error takes place. The software can read the status register to check if the time-out error takes place without OS time tick support or data request asserted. <i>Note: The register bit will be cleared when register MSDC_INT is read.</i> 0: No interrupt request existing. 1: Interrupt request exists.
2	DRQ	DRQ	Indicates if any data transfer is required When a data transfer is required, the register bit will still be active even if register bit DIRQEN in register MSDC_CFG is disabled. Data transfer can be achieved by DMA channel alleviating MCU loading, or by polling the register bit to check if any data transfer is requested. When register bit DIRQEN in register MSDC_CFG is disabled, the second method is used. 0: No DMA request existing. 1: DMA request exists.
1	BE	BE	Indicates if FIFO in SD controller is empty 0: FIFO in SD controller is not empty. 1: FIFO in SD controller is empty.
0	BF	BF	Indicates if FIFO in SD controller is full 0: FIFO in SD controller is not full. 1: FIFO in SD controller is full.

A0270008 **MSDC_INT** SD Memory Card Controller Interrupt Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SDIOIRQ	SDR1BIRQ		SDMCIRQ	SDDATIRQ	SDCMIRQ	PINIRQ	DIRQ
Type									RC	RC		RC	RC	RC	RC	RC
Reset									0	0		0	0	0	0	0

Overview: The register contains the status of interrupts. Note that the register still show status of interrupt even though interrupt is disabled, that is, register bit INTEN of register MSDC_CFG is set to 0. It implies that software interrupt can be implemented by polling register bit INT of register MSDC_STA and this register. However, if hardware interrupt is desired, be sure to clear the register before setting register bit INTEN of register MSDC_CFG to 1, or undesired hardware interrupt arisen from the previous interrupt status may take place.

Bit(s)	Mnemonic	Name	Description
7	SDIOIRQ	SDIOIRQ	SDIO interrupt The register bit indicates if there is any interrupt for SDIO existing. Whenever an interrupt for SDIO exists, the register bit will be set to 1 if the interrupt is enabled. It will be reset when the register is read. 0: No SDIO interrupt 1: Interrupt for SDIO exists.
6	SDR1BIRQ	SDR1BIRQ	SD R1b response interrupt The register bit will be active when a SD command with R1b response is finished and the DAT0 line is transitioned from busy to idle state. Single block write commands with R1b response will cause interrupt when the command is completed either successfully or with CRC error. However, multi-block write commands with R1b response do not cause interrupt because multi-block write commands are always stopped by STOP_TRANS commands. STOP_TRANS commands (with R1b response) behind multi-block write commands will cause interrupt. Single block read command with R1b response will cause interrupt when the command is completed, but multi-block read commands do not. Note: STOP_TRANS commands (with R1b response) behind multi-block read commands will cause interrupt. 0: No interrupt for SD R1b response. 1: Interrupt for SD R1b response exists.
4	SDMCIRQ	SDMCIRQ	SD memory card interrupt The register bit indicates if there is any interrupt for SD memory card existing. Whenever an interrupt for SD memory card exists, i.e. any bit in register SDC_CSTA is active, the register bit will be set to 1 if interrupt is enabled. It will be reset when the register is read. Note: This bit will not trigger MSDC hardware interrupt. 0: No SD memory card interrupt 1: SD memory card interrupt exists.
3	SDDATIRQ	SDDATIRQ	SD bus DAT interrupt The register bit indicates if there is any interrupt for SD DAT line existing. Whenever interrupt for SD DAT line exists, i.e. any bit in register SDC_DATSTA is active, the register bit will be set to 1 if

Bit(s)	Mnemonic	Name	Description
			interrupt is enabled. It will be reset when the register is read. 0: No SD DAT line interrupt 1: SD DAT line interrupt exists.
2	SDCMDIRQ	SDCMDIRQ	SD bus CMD interrupt The register bit indicates if there is any interrupt for SD CMD line existing. Whenever interrupt for SD CMD line exists, i.e. any bit in the register SDC_CMDSTA is active, the register bit will be set to 1 if interrupt is enabled. It will be reset when the register is read. 0: No SD CMD line interrupt 1: SD CMD line interrupt exists.
1	PINIRQ	PINIRQ	Pin change interrupt The register bit indicates if there is any interrupt for memory card insertion/removal existing. Whenever the memory card is inserted or removed and card detection interrupt is enabled, i.e. register bit PINEN in register MSDC_CFG is set to 1, the register bit will be set to 1. It will be reset when the register is read. 0: Otherwise 1: Card is inserted or removed.
0	DIRQ	DIRQ	Data request interrupt The register bit indicates if there is any interrupt for data request existing. Whenever data request exists and data request as an interrupt source is enabled, i.e. register bit DIRQEN in register MSDC_CFG is set to 1, the register bit will be active. It will be reset when being read. For software, data requests can be recognized by polling register bit DRQ or by data request interrupt. Data request interrupts will be generated every FIFOTHD data transfers. 0: No data request interrupt 1: Data request interrupt occurs.

A027000C MSDC_PS SD Memory Card Pin Status Register 00000008

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name								CMD								
Type								RO								
Reset								0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												PINCHG	PIN0	POEN0	PIEN0	CDEN
Type												RC	RO	RW	RW	RW
Reset	0	0	0	0								0	1	0	0	0

Overview: The register is used for card detection. When the memory card controller and system are powered on, the power for the memory card will still be off unless the power is supplied by the PMIC. Meanwhile, the pad for card detection defaults to pull-down when the system is powered on. The scheme of card detection for MS is the same as that for SD. To detect card insertion, first pull up the INS pin and then enable card detection and the input pin at the same time. After 32 cycles of controller clock, the status of pin changes will emerge. To detect card removal, simply keep enabling card detection and the input pin.

Bit(s)	Mnemonic	Name	Description
24	CMD	CMD	Memory card/SDIO card/MMC card command lines
23:16	DAT	DAT	Memory card/SDIO card/MMC card data lines
15:12	CDDEBOUN	CDDEBOUNCE	Specifies the time interval for card detection de-bounce

Bit(s)	Mnemonic	Name	Description
	CE		Default value: 0. It means the de-bounce interval is 32-cycle time at 32kHz. The interval can extend one cycle time at 32kHz by increasing the counter by 1.
4	PINCHG	PINCHG	Pin change The register bit indicates the status of card insertion/removal. If the memory card is inserted or removed, the register bit will be set to 1 no matter pin change interrupt is enabled or not. It will be cleared when the register is read. 0: Otherwise 1: Card is inserted or removed.
3	PINO	PINO	Shows the value of input pin for card detection 0: The value of input pin for card detection is logic low. 1: The value of input pin for card detection is logic high.
2	POEN0	POEN0	Controls output of input pin for card detection 0: Output of input pin for card detection is disabled. 1: Output of input pin for card detection is enabled.
1	PIEN0	PIEN0	Controls input pin for card detection 0: Input pin for card detection is disabled. 1: Input pin for card detection is enabled.
0	CDEN	CDEN	Enables card detection The register bit is used to enable or disable card detection. 0: Card detection is disabled. 1: Card detection is enabled.

A0270010 MSDC_DAT SD Memory Card Controller Data Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	DATA[31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DATA[15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register is used to read/write data from/to FIFO inside the SD controller. Data access unit: 32 bits.

Bit(s)	Mnemonic	Name	Description
31:0	DATA	DATA	Reads/Writes data from/to FIFO inside SD controller Data access unit: 32 bits

A0270014 MSDC_IOCON SD Memory Card Controller IO Control Register 010000C3

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name							SAMPLEDLY		FIXDLY		SAMP ON	CRCDIS	CMDS EL	INTLH		DSW
Type							RW		RW		RW	RW	RW	RW		RW
Reset							0	1	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CMDRE					HIGH SPEED	DMABURST	SRCFG1	SRCFG0	ODCCFG1				ODCCFG0		

						D											
Type	RW					RW	RW	RW	RW		RW						
Reset	0					0	0	0	1	1	0	0	0	0	1	1	

Overview: The register specifies the output driving capability and slew rate of IO pads for MSDC. The reset value is suggested setting. If the output driving capability of pins DAT0, DAT1, DAT2 and DAT3 is too large, it is possible to arise ground bounce and thus result in glitch on SCLK. The actual driving current depends on the PAD type selected for the chip.

Bit(s)	Mnemonic	Name	Description
25:24	SAMPLEDL Y	SAMPLEDL Y	Used for SW to select the turn-around delay cycle between write data end bit and CRC status for SD card 00: 0-T delay 01: 1-T delay 10: 2-T delay 11: 3-T delay
23:22	FIXDLY	FIXDLY	Used for SW to select the delay cycle after clock fix high for the host controller to SD card 00: 0-T delay 01: 1-T delay 10: 2-T delay 11: 3-T delay
21	SAMPON	SAMPON	Data sample enabling always on The bit is suggested to be set to 1 when the feedback clock is used and to 0 when the multiple phase clock is used. 0: Data sample enabling not always on 1: Data sample enabling always on
20	CRC DIS	CRC DIS	Switches off data CRC check for SD read data 0: CRC check is on. 1: CRC check is off.
19	CMDSEL	CMDSEL	Determines whether the host should delay 1-T to latch response from card 0: Host latches response without 1-T delay 1: Host latches response with 1-T delay.
18:17	INTLH	INTLH	Selects latch timing for SDIO multi-block read interrupt 00: Host latches INT at the second backend clock after the end bit of the current data block from card is received. (Default) 01: Host latches INT at the first backend clock after the end bit of the current data block from card is received. 10: Host latches INT at the second backend clock after the end bit of the current data block from card is received. 11: Host latches INT at the third backend clock after the end bit of the current data block from card is received.
16	DSW	DSW	Determines whether the host should latch data with 1-T delay or not For SD card, this bit is suggested to be 0. For MSPRO cards, it is suggested to be 1. 0: Host latches the data with 1-T delay. 1: Host latches the data without 1-T delay.
15	CMDRE	CMDRE	Determines whether the host should latch response token (sent from card on CMD line) at rising edge or falling edge of serial clock (T.B.D this bit is un-useful) 0: Host latches response at rising edge of serial clock.

Bit(s)	Mnemonic	Name	Description
10	HIGH_SPEE D	HIGH_SPEED	1: Host latches response at falling edge of serial clock. For high-speed mode when internal sample clock is used High-speed mode means the SD/MMC serial bus clock rate is bigger than 25MHz. The default speed mode means that the SD/MMC serial bus clock rate is bigger than 25MHz. 0: Default speed 1: High speed
9:8	DMABURST	DMABURST	Used for SW to select burst type when data are transferred by DMA <i>Note: Only single mode can support non-4N bytes data transfer in read operation.</i> 00: Single mode 01: 4-beat incrementing burst 10: 8-beat incrementing burst 11: Reserved
7	SRCFG1	SRCFG1	Output driving capability for pins DAT0, DAT1, DAT2 and DAT3 0: Fast slew rate 1: Slow slew rate
6	SRCFG0	SRCFG0	Output driving capability for pins CMD/BS and SCLK 0: Fast slew rate 1: Slow slew rate
5:3	ODCCFG1	ODCCFG1	Output driving capability for pins DAT0, DAT1, DAT2 and DAT3 000: 4mA 001: 8mA 010: 12mA 011: 16mA
2:0	ODCCFG0	ODCCFG0	Output driving capability for pins CMD/BS and SCLK 000: 4mA 001: 8mA 010: 12mA 011: 16mA

A0270018 MSDC IOCON1 SD Memory Card Controller IO Control Register 1 00022022

Name	BSYDLY								BLKLEN							
Type	RW								RW							
Reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register is used to configure the SD memory card controller when it is configured as the host of SD. The register is used to configure the SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the controller. Note that SDC_CFG[31:16] can be accessed by 16-bit APB bus access.

Bit(s)	Mnemonic	Name	Description
31:24	DIOC	DIOC	Data time-out counter The period from finish of the initial host read command or the last read data block in a multiple block read operation to the start bit of the next read data block requires at least two serial clock cycles. The counter is used to extend the period (Read Data Access Time) in unit of 65,536 serial clock. See the register field descriptions of register

Bit(s)	Mnemonic	Name	Description
			bit RDINT for reference. 00000000: Extend 65,536 more serial clock cycles 00000001: Extend 65,536x2 more serial clock cycles 00000010: Extend 65,536x3 more serial clock cycles 00000011~11111110: ... 11111111: Extend 65,536x 256 more serial clock cycles
23:20	WDOD	WDOD	Write data output delay The period from finish of the response for the initial host write command or the last write data block in a multiple block write operation to the start bit of the next write data block requires at least two serial clock cycles. The register field is used to extend the period (Write Data Output Delay) in unit of one serial clock. 0000: No extension 0001: Extend 1 more serial clock cycle 0010: Extend 2 more serial clock cycles 0011~1110: ... 1111: Extend 15 more serial clock cycle
19	SDIO	SDIO	Enables SDIO 0: Disable SDIO mode 1: Enable SDIO mode
17	MDLEN	MDLEN	Enables multiple data line The register can be enabled only when SD memory card is applied and detected by software application. It is the responsibility of the application to program the bit correctly when an multi-media card is applied. If an multi-media card is applied and 4-bit data line is enabled, the 4 bits will be output every serial clock. Therefore, data integrity will fail. 0: Disable 4-bit data line 1: Enable 4-bit data line
16	SIEN	SIEN	Enables serial interface It should be enabled as soon as possible before any command. 0: Disable serial interface for SD 1: Enable serial interface for SD
15:12	BSYDLY	BSYDLY	Only valid for the commands with R1b response If the command has a response of R1b type, the SD controller must monitor the data line 0 for card busy status from the bit time that is two serial clock cycles after the command end bit to check if the operation in SD memory card have finished. The register field is used to expand the time between the command end bit and end of detection period to detect card busy status. If time is up and there is no card busy status on data line 0, the controller will abandon the detection. 0000: No extension 0001: Extend 1 more serial clock cycle 0010: Extend 2 more serial clock cycles 0011~1110: ... 1111: Extend 15 more serial clock cycle
11:0	BLKLEN	BLKLEN	Block length The register field is used to define the length of one block in unit of byte in a data transaction. The maximum value of block length is 2,048 bytes. 000000000000: Reserved 000000000001: Block length is 1 byte. 000000000010: Block length is 2 bytes. 000000000011~011111111110: ...

Bit(s)	Mnemonic	Name	Description
			011111111111: Block length is 2,047 bytes. 100000000000: Block length is 2,048 bytes.

A0270024 SDC_CMD SD Memory Card Controller Command Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																CMDFAIL
Type																RW
Reset																0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	INTC	STOP	RW	DTYPE	IDRT			RSPTYP		BREAK						CMD
Type	RW	RW	RW	RW	RW			RW		RW						RW
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register defines a SD memory card command and its attribute. Before the SD controller issues a transaction onto the SD bus, application shall specify other relative settings such as argument for command. After application writes the register, the SD controller will issue the corresponding transaction onto the SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD bus run 128 cycles before issuing the command.

Bit(s)	Mnemonic	Name	Description
16	CMDFAIL	CMDFAIL	If 4-bit SDIO mode is enabled and when CMD/DAT error occurs, set this bit to select whether to "wait stop command" or "wait data state machine idle". 0: Wait stop command 1: Wait data state machine idle
15	INTC	INTC	Indicates if the command is GO_IRQ_STATE If the command is GO_IRQ_STATE, the period between command token and response token will not be limited. 0: The command is not GO_IRQ_STATE. 1: The command is GO_IRQ_STATE
14	STOP	STOP	Indicates if the command is a stop transmission command 0: The command is not a stop transmission command. 1: The command is a stop transmission command.
13	RW	RW	Defines the command is a read command or write command The register bit is valid only when the command causes a transaction with data token. 0: The command is a read command. 1: The command is a write command.
12:11	DTYPE	DTYPE	Defines data token type for the command 00: No data token for the command 01: Single block transaction 10: Multiple block transaction, i.e. the command is a multiple block read or write command. 11: Stream operation. It can only be used when an multi-media card is applied.
10	IDRT	IDRT	Identification response time The register bit indicates if the command has a response with NID (i.e. 5 serial clock cycles as defined in SD Memory Card Specification Part 1 Physical Layer Specification version 1.0)

Bit(s)	Mnemonic	Name	Description
			response time. The register bit is valid only when the command has a response token. Thus the register bit must be set to 1 for CMD2 (ALL_SEND_CID) and A CMD41 (SD_APP_OP_CMD).
			0: Otherwise
			1: The command has a response with NID response time.
9:7	RSPTYP	RSPTYP	Defines response type for the command For commands with R1 and R1b response, register SDC_CSTA (not SDC_STA) updates after response token is received. This register SDC_CSTA contains the status of the SD, and it can be used as a response interrupt source. <i>Note: If CMD7 is used with all 0's RCA, then RSPTYP must be '000'. Command "GO_TO_IDLE" also has RSPTYP='000'.</i> 000: There is no response for the command, e.g. broadcast command without response and GO_INACTIVE_STATE command. 001: The command has R1 response. R1 response token is 48-bit. 010: The command has R2 response. R2 response token is 136-bit. 011: The command has R3 response. Even though R3 is 48-bit response, it does not contain CRC checksum. 100: The command has R4 response. R4 response token is 48-bit. (only for MMC) 101: The command has R5 response. R5 response token is 48-bit. (only for MMC) 110: The command has R6 response. R6 response token is 48-bit. 111: The command has R1b response. If the command has a response of R1b type, SD controller must monitor the data line 0 for card busy status from the bit time that is 2 or 4 serial clock cycles after the command end bit to check if the operation in SD memory card has finished. There are two cases for detection of card busy status. The first case is that the host stops the data transmission during an active write data transfer. The card will assert busy signal after the stop transmission command end bit followed by 4 serial clock cycles. The second case is that the card is in idle state or receiving a stop transmission command between data blocks when multiple block write command is in progress. The register bit will be valid only when the command has a response token.
6	BREAK	BREAK	Aborts pending MMC GO_IRQ_MODE command It is only valid for a pending GO_IRQ_MODE command waiting for MMC interrupt response. 0: Other fields are valid. 1: Break a pending MMC GO_IRQ_MODE command in the controller. Other fields are invalid.
5:0	CMD	CMD	SD memory card command Total 6 bits.

A0270028	SDC_ARG	SD Memory Card Controller Argument Register	00000000													
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	ARG[31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	ARG[15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register contains the argument of the SD memory card command.

Bit(s)	Mnemonic	Name	Description
31:0	ARG	ARG	Contains argument of the SD memory card command.

A027002C SDC_STA SD Memory Card Controller Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	WP											FEDATBUS Y	FECMDBUS Y	BEDATBUS Y	BECMDBUS Y	BESDCBUS Y
Type	RO											RO	RO	RO	RO	RO
Reset	0											0	0	0	0	0

Overview: The register contains various statuses of SD controller as the controller is configured as the host of SD memory card.

Bit(s)	Mnemonic	Name	Description
15	WP	WP	Detects the status of write protection switch on SD memory card The register bit shows the status of write protection switch on SD memory card. There is no default reset value. Pin WP (Write Protection) is only useful when the controller is configured for SD memory card. 1: Write protection switch on, i.e. memory card is desired to be write-protected. 0: Write protection switch off, i.e. memory card is writable.
4	FEDATBUS Y	FEDATBUSY	Indicates if there is any transmission going on DAT line on SD bus This bit indicates directly the CMD line at card clock domain. For those commands without data but still involving DAT line, the register bit is useless. For example, if an erase command is issued, checking if the register bit is 0 before issuing the next command with data will not guarantee that the controller is idle. In this case, use register bit BESDCBUSY. 0: No transmission is going on DAT line on SD bus. 1: There is transmission going on DAT line on SD bus.
3	FECMDBUS Y	FECMDBUSY	Indicates if there is any transmission going on CMD line on SD bus This bit indicates directly the CMD line at card clock domain. 0: No transmission is going on CMD line on SD bus. 1: There is transmission going on CMD line on SD bus.
2	BEDATBUS Y	BEDATBUSY	Indicates if there is any transmission going on DAT line on SD bus 0: Backend SDC controller gets the info that no transmission is going on DAT line on SD bus. 1: Backend SDC controller gets the info that there is transmission going on DAT line on SD bus.
1	BECMDBUS	BECMDBUSY	Indicates if there is any transmission going on CMD line on SD bus

Bit(s)	Mnemonic	Name	Description
Y			bus This bit shows backend controller's CMD busy state. The busy state is synced from card clock domain to bus clock domain. 0: Backend SDC controller gets the info that no transmission is going on CMD line on SD bus. 1: Backend SDC controller gets the info that there is transmission going on CMD line on SD bus.
0	BESDCBUS	BESDCBUSY	Indicates if SD controller is busy, i.e. is there any transmission going on CMD or DAT line on SD bus This bit shows backend controller's SDC busy state. The busy state is synced from card clock domain to bus clock domain. 0: Backend SD controller is idle. 1: Backend SD controller is busy.

A0270030 SDC_RESP0 SD Memory Card Controller Response Register 0 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31:0	RESP[95:64]	RESP_95_64	

A027003C SDC_RESP3 SD Memory Card Controller Response Register 3 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	RESP[127:96][31:16]															
Type	RO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	RESP[127:96][15:0]															
Type	RO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register contains parts of the last SD memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 compose the last SD memory card bus response. For response of type R2, i.e. response of commands ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of the response token are stored in register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. For response of other types, only bit 39 to 8 of the response token are stored in register field SDC_RESP0.

Bit(s)	Mnemonic	Name	Description
31:0	RESP[127:96]	RESP_127_96	

A0270040 SDC_CMDSTA SD Memory Card Controller Command Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														RSPC RCER R	CMDT O	CMDR DY
Type														RC	RC	RC
Reset														0	0	0

Overview: The register contains the status of SD controller during command execution and that of SD bus protocol after command execution when the SD controller is configured as the host of SD memory card. The

register can also be used as an interrupt source. The register is cleared when being read. Meanwhile, if the interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.

Bit(s)	Mnemonic	Name	Description
2	RSPRCER R	RSPRCERR	CRC error on CMD detected '1' indicates the SD controller detects a CRC error after reading a response from the CMD line. 0: Otherwise 1: SD controller detects a CRC error after reading a response from the CMD line.
1	CMDTO	CMDTO	Time-out on CMD detected '1' indicates the SD controller detects a time-out condition while waiting for a response on the CMD line. 0: Otherwise 1: SD controller detects a timeout condition while waiting for a response on the CMD line.
0	CMDRDY	CMDRDY	For command without response, the register bit will be 1 once the command is completed on SD bus For command with response, the register bit will be 1 whenever the command is issued onto the SD bus and its corresponding response is received without CRC error. 0: Otherwise 1: Command with/without response is finished successfully without CRC error.

A0270044 SDC DATSTA SD Memory Card Controller Data Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name							DATCRCERR								DATTO	BLKDONE
Type							RC								RC	RC
Reset							0	0	0	0	0	0	0	0	0	0

Overview: The register contains the status of SD controller during data transfer on DAT line(s) when the SD controller is configured as the host of SD memory card. The register can be used as an interrupt source. The register is cleared when being read. Meanwhile, if the interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.

Bit(s)	Mnemonic	Name	Description
9:2 R	DATRCER R	DATRCERR	CRC error on DAT detected '1' indicates that the SD controller detects a CRC error for bit n after reading a block of data from the DAT line or SD signals a CRC error after writing a block of data to the DAT line. 0: Otherwise 1: SD controller detects a CRC error after reading a block of data from the DAT line or SD signals a CRC error after writing a block of data to the DAT line. <i>Note: n is 7 ~ 1 for 8-bits mode. Each bit is read and cleared</i>

Bit(s)	Mnemonic	Name	Description
1	DATTO	DATTO	<i>individually.</i> Time-out on DAT detected A '1' indicates that the SD controller detects a time-out condition while waiting for data token on the DAT line. 0: Otherwise 1: SD controller detects a time-out condition while waiting for data token on the DAT line.
0	BLKDONE	BLKDONE	Indicates the status of data block transfer 0: Otherwise 1: A data block is successfully transferred.

A0270048 SDC_CSTA SD Memory Card Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	CSTA [31:0][31:16]															
Type	RC															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	CSTA [31:0][15:0]															
Type	RC															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: After commands with R1 and R1b respond this register containing the status of the SD card, it will be used as a response interrupt source. In all register fields, logic high indicates error, and logic low indicates no error. The register is cleared when being read. Meanwhile, if the interrupt is enabled and thus interrupt caused by the register is generated, reading the register will de-assert the interrupt.

Bit(s)	Mnemonic	Name	Description
31:0	CSTA [31:0]	CSTA_31_0	CSTA31: OUT_OF_RANGE. The command's argument is out of the allowed range for this card. CSTA30: ADDRESS_ERROR. A misaligned address that does not match the block length is used in the command. CSTA29: BLOCK_LEN_ERROR. The transferred block length is not allowed for this card, or the number of transferred bytes does not match the block length. CSTA28: ERASE_SEQ_ERROR. An error in the sequence of erase commands occurs. CSTA27: ERASE_PARAM. An invalid selection of write-blocks for erase occurs. CSTA26: WP_VIOLATION. Attempt to program a write-protected block. CSTA25: Reserved. Return to 0. CSTA24: LOCK_UNLOCK_FAILED. Set when a sequence or password error is detected in lock/unlock card command or if there is an attempt to access a locked card. CSTA23: COM_CRC_ERROR. The CRC check of the previous command fails. CSTA22: ILLEGAL_COMMAND. Command not legal for the card state. CSTA21: CARD_ECC_FAILED. Card internal ECC is applied but fails to correct the data. CSTA20: CC_ERROR. Internal card controller error.

CSTA19: ERROR. A general or unknown error occurs during the operation.

CSTA18: UNDERRUN. The card cannot sustain data transfer in stream read mode.

CSTA17: OVERRUN. The card cannot sustain data programming in stream write mode.

CSTA16: CID/CSD_OVERWRITE. It can be either one of the following errors: 1) The CID register has been already written and cannot be overwritten; 2) The read-only section of the CSD does not match the card; 3) An attempt to reverse the copy (set as the original) or permanent WP (unprotected) bits is made.

CSTA[15: 4]: Reserved. Return to 0.

CSTA3: AKE_SEQ_ERROR. Error in the sequence of authentication process

CSTA[2: 0]: Reserved. Return to 0.

A027004C SDC_IRQMASK0 SD Memory Card IRQ Mask Register 0 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	IRQMASK [31:0][31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	IRQMASK [31:0][15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register contains parts of SD memory card interrupt mask register. See the register descriptions of register SDC_IRQMASK1 for reference. The register masks interrupt sources from register SDC_CMDSTA and SDC_DATSTA. IRQMASK[3:0] is for SDC_CMDSTA, and IRQMASK[18:16] for SDC_DATSTA. Note that IRQMASK[18] masks SDC_DATSTA[9:2] together. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[0] is 1, then the interrupt source from register field CMDRDY of register SDC_CMDSTA will be masked. '0' in some bits does not cause interrupt mask on the corresponding interrupt source from registers SDC_CMDSTA and SDC_DATSTA.

Bit(s)	Mnemonic	Name	Description
31:0	IRQMASK [31:0]	IRQMASK_31_0	

A0270050 SDC_IRQMASK1 SD Memory Card IRQ Mask Register 1 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	IRQMASK [63:32][31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	IRQMASK [63:32][15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register contains parts of SD memory card interrupt mask register. Registers SDC_IRQMASK1 and SDC_IRQMASK0 compose the SD memory card interrupt mask register. The register masks interrupt

sources from register SDC_CSTA. '1' in some bits of the register masks the corresponding interrupt source with the same bit position. For example, if IRQMASK[63] is 1, then the interrupt source from register field OUT_OF_RANGE of register SDC_CSTA will be masked. '0' in some bits does not cause interrupt mask on the corresponding interrupt source from register SDC_CSTA.

Bit(s)	Mnemonic	Name	Description
31:0	IRQMASK [63:32]	IRQMASK_63_32	

A0270054 SDIO_CFG SDIO Configuration Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											DISSEL		INTCSEL	DSBSEL		INTEN
Type											RW		RW	RW		RW
Reset											0		0	0		0

Overview: The register is used to configure functions for SDIO.

Bit(s)	Mnemonic	Name	Description
5	DISSEL	DISSEL	Selects data block interrupt source 0: The host detects SDIO interrupt during interrupt period between two data blocks of multiple block data access. 1: The host ignores SDIO interrupt during interrupt period between two data blocks of multiple block data access.
3	INTCSEL	INTCSEL	Selects interrupt control 0: The host detects DAT1 low as SDIO interrupt. 1: The host detects DAT3/DAT2/DAT1/DAT0 4'b1101 as SDIO interrupt.
2	DSBSEL	DSBSEL	Selects data block start bit 0: Use data line 0 as start bit of data block. Other data lines are ignored. 1: Start bit of a data block is received only when all data line 0-3 become low.
0	INTEN	INTEN	Enables interrupt for SDIO 0: Disable 1: Enable

A0270058 SDIO_STA SDIO Status Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																IRQ
Type																RO
Reset																0

Overview: This register is used to identify if there is SDIO interrupt during the interrupt period on data line.

Bit(s)	Mnemonic	Name	Description
0	IRQ	IRQ	SDIO interrupt exists on the data line. For example, when in the interrupt period or the 1-bit data line mode and DAT1/5 goes low from high, this bit will become 1 from 0. If DAT1/5 goes high from low, this bit will become 0 from 1. 0: There is no SDIO interrupt existing on the data line. 1: There is SDIO interrupt existing on the data line.

A0270080 CLK_RED CLK Latch Configuration Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name			CMD_RED													
Type			RW													
Reset			0													
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name			DAT_RED						CLKP_AD_R	CLK_LATCH						
Type			RW						RW	RW						
Reset			0						0	0						

Overview: The register is used to configure the MSDC sample data/response clock. Note that only when MSDC_IOCON[19] = 1 will the host latch response; otherwise MSDC FSM will handle the response from PAD directly.

Bit(s)	Mnemonic	Name	Description
29	CMD_RED	CMD_RED	Determines the command response from card output is latched at falling edge or rising edge of internal clock Only effective when CLK_LATCH = 1 0: Internal clock rising edge to latch response 1: Internal clock falling edge to latch response
13	DAT_RED	DAT_RED	Determines the input data from card output is latched at falling edge or rising edge of internal sample clock Only effective when CLK_LATCH = 1 0: Internal clock rising edge to latch data 1: Internal clock falling edge to latch data
7	CLKPAD_R	CLKPAD_RED	Determines the input data from card is latched at falling edge or rising edge of the feedback clock from pad The suggested setting is 0 when SD serial clock is lower than 25MHz. The suggestion setting is 1 when SD serial clock is higher than 25MHz. The suggestion setting is 0 for MMC card no matter the serial clock rate is high speed or default speed. Only effective when CLK_LATCH = 0. 0: Internal feedback clock rising edge to latch data/response 1: Internal feedback clock falling edge to latch data/response
6	CLK_LATCH	CLK_LATCH	Determines which clock to latch data from card The suggested setting is 1 if SCLKF in register field MSDC_CFG is 0x0. Otherwise, the suggested setting is 0. 0: Internal feedback clock is used to latch data/response from card.

Bit(s)	Mnemonic	Name	Description
1: Internal clock is used to latch data/response from card.			

A0270098 DAT_CHECKSUM MSDC Rx Data Checksum Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	DAT_CHECKSUM[31:16]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DAT_CHECKSUM[15:0]															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Overview: The register is used to complete the checksum value of Rx read data

Bit(s)	Mnemonic	Name	Description
31:0	DAT_CHEC KSUM	DAT_CHECKSUM	The checksum algorithm is 32-bit XOR.

3.18 BTIF

3.18.1 General Description

Bluetooth Interface (BTIF) is designed in SOC (BT+GSM) as the UART interface between the BT chip and baseband chip. As in the UART design, BTIF is an APB slave which transmits or receives data by MCU access or through DMA/FIFO.

Figure 48. Interface connection between BT and baseband system

3.18.2 Register Definition

BTIF+0000h Rx Buffer Register

BTIF_RBR

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RBR[7:0]							
Type									RO							

RBR Rx buffer register. A read-only register. The received data can be read by accessing this register. This register is valid only when BTIF_FAKELCR[7] (0x0C) is 0.

BTIF+0000h Tx Holding Register

BTIF_THR

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									THR[7:0]							
Type									WO							

THR Tx holding register. A write-only register. The data to be transmitted are written to this register and sent to the Bluetooth via BTIF. This register is valid only when BTIF_FAKELCR[7] (0x0C) is 0.

BTIF+0004h Interrupt Enable Register

BTIF_IER

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															TXEEN	RXFEN
Type															W/R	W/R
Reset															0	0

This register is valid only when BTIF_FAKELCR[7] is 0.

TXEEN Enables Tx empty interrupt. When set to 1, an interrupt will be generated if the Tx holding register is empty.

0 No interrupt will be generated if the Tx holding register is empty.

1 An interrupt will be generated if the Tx holding register is empty

RXFEN Enables Rx full interrupt. When set to 1, an interrupt will be generated if the Rx buffer contains data.

0 No interrupt will be generated if the Rx buffer contains data.

1 An interrupt will be generated if the Rx buffer contains data.

BTIF+0008h Interrupt Identification Register BTIF_IIR

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													ID2	ID1	ID0	NINT
Type													RO	RO	RO	RO
Reset													0	0	0	1

This register is valid only when BTIF_FAKELCR (0x0C) is not 0xBF.

IIR Identifies if there are pending interrupts. The following table lists the IIR[5:0] codes associated with the possible interrupts:

Table 52. IIR[5:0] codes associated with the possible interrupts

IIR[3:0]	Priority level	Interrupt	Source
0001	-	No pending interrupt	
0100	1	Rx data received	Rx data received
1100	2	Rx data time-out	Time-out on character in Rx buffer
0010	3	Tx holding register empty	Tx holding register empty.

Rx data received interrupt

A Rx received interrupt (IIR[3:0] = 0x04) is generated when RXFEN (IER[0]) is set and Rx data are placed in the Rx buffer register. The interrupt is cleared by reading the Rx buffer register.

Rx data time-out interrupt

The Rx data time-out interrupt will be generated if all of the following conditions are applied:

1. Rx buffer is empty.
2. The most recent character is received longer than (RTOCNT*blk period*4).
3. RXFEN (IER[0]) is set to 1.

The time-out timer is restarted upon receipt of a new byte from the Rx shift register. This interrupt is only valid while VFIFO is used. This register is cleared by reading the VFIFO status register (0x4C).

Tx holding register empty

A Tx holding register empty interrupt (IIR[3:0] = 0x02) is generated when TXEEN (IER[1]) is set and no data are placed in the Tx holding register. This interrupt is cleared by writing data into BTIF_THR (0x00).

BTIF+0008h FIFO_CTRL

BTIF_FIFOC
RL

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														CLRT	CLRR	
Type														WO	WO	
Reset														0	0	

This register is valid only when BTIF_FAKELCR (0x0C) is not 0xBF.

CLRT Clears transmit FIFO. This bit is self-clearing.

0 Leave Tx FIFO intact.

1 Clear all the bytes in Tx FIFO.

CLRR Clears receive FIFO. This bit is self-clearing.

0 Leave Rx FIFO intact.

1 Clear all the bytes in Rx FIFO.

BTIF+000Ch FAKE LCR

BTIF_FAKE
LCR

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FAKELCR[7:0]							
Type									R/W							
Reset									0	0	0	0	0	0	0	0

FAKELCR This register is added to synchronize the software control method of UART. When FAKELCR[7] is 1, RBR(0x00), THR(0x00) and IER(0x04) will not be readable/writable. When FAKELCR is 0xBF, RBR(0x00), THR(0x00), IER(0x04), IIR(0x08) and LSR(0x14) will not be readable/writable.

BTIF+0014h Line Status Register

BTIF_LSR

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name										TEMT	THRE					DR
Type										RO	RO					RO
Reset										1	1					0

LSR Line status register. Readable when LCR ≠ 0xBF.

TEMT Tx holding register is empty.

0 Empty conditions are not met.

1 This bit is set when the Tx holding register is empty.

THRE Indicates if Tx FIFO is reduced to its trigger level

0 Reset whenever the contents of Tx FIFO are more than its trigger level (FIFOs are enabled)

1 Set whenever the contents of Tx FIFO are reduced to its trigger level (FIFOs are enabled)

DR Data Ready

0 Cleared by reading the Rx buffer.

1 Set by the Rx buffer becoming full.

BTIF+0048h Sleep Enable Register

BTIF_SLEEP_EN

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SLEEP_EN
Type																R/W
Reset																0

SLEEP_EN For sleep mode issue

0 Does not deal with sleep mode indication signal

1 Activate flow control according to software initial settings when the chip enters the sleep mode. Release hardware flow when the chip wakes up.

BTIFn+004Ch DMA Enable Register

BTIF_DMA_EN

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														TO_CNT_AUTOST	TX_DMA_EN	RX_DMA_EN
Type														R/W	R/W	R/W
Reset														0	0	0

RX_DMA_EN RX_DMA mechanism enabling signal

0 Does not use DMA in Rx.

1 Use DMA in Rx. When this register is enabled, the flow control is based on the DMA threshold and generates a time-out interrupt

TX_DMA_EN TX_DMA mechanism enabling signal

0 Does not use DMA in Tx.

1 Use DMA in Tx. When this register is enabled, the flow control is based on the DMA threshold and generates a time-out interrupt for DMA.

- TO_CNT_AUTORST** Time-out counter auto reset register
- 0 After Rx time-out takes place, the software shall reset the interrupt by reading BTIF 0x4C.
 - 1 The time-out counter will be auto reset.

BTIF+0054h Rx Time-out Count
BTIF_RTOCNT

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset																

RTOCNT Used for Rx time-out interrupt. The Rx time-out interrupt will be generated when:

1. RXFEN (0x04[0]) is set to 1.
2. Rx buffer is empty.
3. The most recent character is received longer than (RTOCNT*blk period*4).

BTIF+0060h TRX_TRIGGER_LEVEL
BTIF_TRI_LVL

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																
Type																
Reset																

TX_TRI_LVL Used for Tx FIFO trigger threshold. THRE(0x14[5]) will be set if the data in the TXFIFO are less than TX_TRI_LVL.

RX_TRI_LVL Used for Rx FIFO trigger threshold. A Rx trigger interrupt (IIR(0x08)) = 4) might be set if the data in the RXFIFO are more than RX_TRI_LVL. The output flow control signal will also be set if the data in the RXFIFO are more than RX_TRI_LVL.

BTIF_LOOP Enables BTIF loop back mode. The data output from Tx will be received by Rx.

BTIF+0064h SLEEP_WAKEUP
BTIF_WAK

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																

Type																	WO
Reset																	1

SLEEP_WAKE ARM9 side btif_sleep_wakeup_in_b is connected to eint[16] (ARM9 has eint[19:0].
ARM7 side btif_sleep_wakeup_in_b is connected to eint[0] (ARM7 has eint[3:0])

BTIF+0068h ASYNC_WAIT_TIME

BTIF_WAT_TIME

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											WAT_TIME_2			WAT_TIME_1		
Type											R/W			R/W		
Reset											0x2			0x2		

ASYNC_WAIT_TIME Sets up waiting time of RX read-out.

WAT_TIME_1 The first level of wait time.

WAT_TIME_2 The second level of wait time.

Notes: The value of WAT_TIME_1/ WAT_TIME_1 cannot be smaller than 0x2.

BTIF+006Ch NEW_HANDSHAKE

BTIF_HANDSHAKE

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														RTO_EXT	HIGH_SPEED_EN	HANDSHAKE_EN
Type														R/W	R/W	R/W
Reset														0	0	1

NEW_HANDSHAKE The default value of handshake is 0. The function of handshake is disabled.
The function of BTIF has limitation. The ratio of bclk cannot be bigger than 2; otherwise, two system data transmissions will be wrong. If the value of handshake is 1, the ratio of bclk will be free.

HANDSHAKE_EN Enables handshake mode.

high_speed_en Enables high speed mode. Reserved.

RTO_EXT Extends the value of RX time-out counter (16*rto_time).

4 GPS

4.1 RF Part

4.1.1 LNA/Mixer

Upon receiving RF input signal in through either multi-GNSS antenna to internal LNA or external antenna and LNA, the mixer down converts the amplified signal (GPS/Galileo=1575.42MHz, Beidou=1561.098-MHz, GLONASS=1601.71-MHz). The current chip provides 2 configurations to choose from, which are high-gain LNA and low-gain LNA. The high-gain LNA is used for low-cost solution without external LNA. The low-gain LNA offers high linearity to allow high external LNA gain, with much worsen noise figure performance. In the application with external LNA, the external LNA gain ranging from 15 to 20 dB is recommended. The down-conversion mixer is single-ended passive mixer with current mode interface between the mixer and multi-modes low pass filter.

4.1.2 VCO/Synthesizer

The entire frequency synthesizer includes crystal oscillator, VCO, divider, phase frequency detector (PFD), charge pump (CP) and loop filter which are all integrated on the MT2503A chip. Upon power-on, VCO is auto-calibrated to its required sub-band. The synthesizer adopts fractional-N sigma-delta PLL topology, which supports 12.6 to 40MHz reference clock frequencies.

4.1.3 LPF

The current-mode LPF supports multiple modes for different GNSS combinations. The LPF also provides 26dB gain-control range, with approximately 2dB per step.

4.1.4 ADC

The differential IF signal is being quantized by a high performance ADC. The sampling clock can be provided from divided clock from LO.

4.2 Digital Part

4.2.1 ARM7EJ-S

The ARM7EJ-S processor provides flexibility necessary for building Java-enabled, real-time embedded devices requiring small size, low-power and high performance. It builds on the features and benefits of the established ARM7TDMI core and is delivered in synthesizable form. ARM7EJ-S is supported by a wide variety of development tools and can run at speeding up to 158 MHz.

ARM7EJ-S includes a JTAG interface which provides a standard development and debugging interface. The interface can connect to a variety of off-the-shelf emulators. The emulators provide single-step, trap and access to all the internal registers of the digital part of MT2503A.

4.2.2 Cache

MT2503A provides cache to speed up program execution and reduce external flash access times. It supports up to 64 Kbits cache buffer and can be used as internal memory when it is not fully used.

4.2.3 Boot ROM

The embedded boot ROM provides a function of loading a set of user code through the host interface into SRAM. The host interface (UART/SPI/I2C) is decided by strap control.

4.2.4 Real Time Clock (RTC)

MT2503A provides very low leakage battery backed-up memory, which contains all the necessary multi-GNSS information for quick start-up and a small amount of user configuration variables. There is a built-in 1.1 volts LDO for RTC domain and it can be bypassed while an external LDO is applied. The RTC LDO is a voltage regulator having very low quiescent current. The small ceramic capacitor can be used as the output capacitor, and the stable operation region ranges from very light load (~ 0) to about 3 mA.

Figure 49. RTC with internal RTC LDO application circuit 1

Figure 50. RTC with internal RTC LDO application circuit 2

4.2.5 SMPS

A built-in switching mode power supply provides 1.8 volts power supply for the digital 1.1 volts CLDO and RF input power. In the active mode, SMPS is operated in the PWM/PFM automatic mode. In the power saving mode, SMPS is operated with reduced switching frequency in the PFM mode. The recommended L/C value is 1 μ H / 4.7 μ F.

4.2.6 Timer function

The timer function supports a time tick generation of 31.25 ms resolution. With the 24-bit counter, the period of timer is from 31.25 ms to 524,287 s.

4.2.7 GPIO in RTC domain

The “32K_OUT” pin in RTC domain can output 32.768 KHz clock which can be used to support low clock rate operation mode for some applications or peripherals that need an external clock source. This pin can also be programmed to be an input pin to receive the signal from an external accelerator sensor IC to be the wake-up signal of MT2503A when it is in the low-power mode.

4.2.8 Low power detection

A low power detection circuit is implemented. Whenever the independent power source (AVDD11_RTC) becomes low voltage, the low power detection circuit will detect this condition and use an indicator signal (output high in normal condition and low in low-power condition) to reflect this condition.

4.2.9 Clock module

The clock module generates all internal clocks required by processor, correlator, internal memory, bus interface and so on. The referenced input clock is generated from the RF block. For system flexibility and maximum power saving, it supports various power management modes.

4.2.10 Reset controller

The built-in reset controller generates reset signals for all digital blocks. It has power-on reset feature and hardware trapping function. The power-on reset level is 2.7 ± 0.1 volts. The software reset function for different circuit blocks are also included for flexible applications.

In Figure 51, the voltage drop time T_{drop_vbat} and $T_{drop_cl do}$ depend on the capacitance connection of their power net. But $T_{drop_vbat} > T_{drop_cl do}$ should be guaranteed for the correct operation of reset behavior during power off sequence. It is strongly recommend using external LDOs without output discharged function or make sure $T_{drop_vbat} > 100$ ms.

Figure 51. Power on reset diagram

Figure 52. Power on/off reset behavior

4.2.11 Host interface

MT2503A supports 3 different host interfaces, which are UART, SPI, and I2C. The interface used as the host interface is determined by strap pins. Note that SPI and I2C support firmware update only for now.

4.2.11.1 UART

UART is the abbreviation of "Universal Asynchronous Receiver/Transmitter". MT2503A has 3 full duplex serial ports. It is used for serial data communication. A UART converts bytes of data to and from asynchronous start-stop bit streams represented as binary electrical impulses.

There are several functions in MT2503A related to UART communication, such as UART data transmission/receive and NMEA sentences input/output. In general, UART0 is as NMEA output and PMTK command input, UART1 as RTCM input. You can adjust the UART2 port as desired. The receiver (RX) and transmitter (TX) side of every port contains a 16-byte FIFO, but only UART0 has 256 bytes of URAM. The bit rates are selectable and range from 4.8 to 921.6 kbps. UART provides signal or message outputs.

4.2.11.2 SPI (by request)

The serial peripheral interface port manages the communication between digital BB and external devices. MT2503A supports both master and slave modes. Only 4 bytes of register in the master mode can be transferred. The slave has 4-byte-register mode or URAM mode. In the URAM mode, the transmitted and received data size is 256 bytes. The clock phase and clock polarity are selectable. MT2503A supports manual or automatic indicator for data transfer in the slave mode.

4.2.11.3 I2C (by request)

The I2C interface is mainly connected to external devices. MT2503A supports multi-master and slave modes. Both modes have 256-byte URAM mode and 8-byte FIFO mode for transmitting and receiving data. The multi-master mode supports 7-bit and 10-bit address modes up to 400 Kb/s fast mode and 3.4 Mb/s high-speed mode. In additions, MT2503A supports manual or automatic indicator for data transfer in the slave mode. Device addresses in the slave mode are programmable and support fast mode and high-speed mode data transmission and reception.

4.2.12 Interrupt control unit

The interrupt control unit manages all internal and external sources of interrupts, which include timer, watch-dog, all interfaces such as UART, I2C and SPI and external user interrupt pins. These interrupt sources can be wake-up events in the power saving mode.

4.2.13 Flash

An external SPI serial flash up to 128 Mb is supported. Specific MTK Flash Tool is also supported for downloading firmware into the internal flash.

4.2.14 GPIO unit

GPIO is the abbreviation of “General-Purpose Input/Output”. MT2503A supports a variety of peripherals through maximum 16 GPIO programmable ports. The unit manages all GPIO lines and supports a simple control interface. GPIO provides signal or message outputs.

4.2.15 PPS

The PPS (Pulse Per Second) signal is provided through designated output pin for many external applications. The pulse is not only limited to being active every second but also allowed to set up the required duration, frequency and active high/low by programming user-defined settings.

4.2.16 ECLK

ECLK is a clock input pin for introducing an external clock signal to MT2503A and obtaining the relation between the external clock and GPS local clock. With precise external clock input, the clock drift of the GPS local clock can be correctly estimated. Therefore, the doppler search range is narrowed down accordingly. The technology is beneficial to speeding up the satellite acquisition process. Particularly in the cold start case, due to limited priori information about the satellite's location and local clock uncertainty, a receiver will execute a search in full frequency range. Consequently, a longer acquisition time is expected. However, the ECLK technology is able to reduce the frequency uncertainty so that the search process will be completed in a short time. Efficient acquisition and lower power consumption are attained by the ECLK technology.

4.2.17 SYNC

SYNC is a time stamp signal input pin for introducing an external timing to the GPS receiver and obtaining the relation between the external timing and the GPS receiver local timing. With precise external timing input and the established relation, the GPS time of week (TOW) can be correctly estimated in the GPS receiver. The technology is beneficial for time to first fix (TTFF), particularly in weak signal environments. In hot starts, with priori information about the GPS receiver's location and satellite ephemeris data, the GPS receiver uses the correct GPS TOW to accurately predict the signal code chip/phase. Therefore, the code search range can be narrowed down accordingly. Hence, fast TTFF is achieved by the SYNC technology.

Figure 53. Flow diagram of SYNC function

4.2.18 Power scheme

Internal SMPS is used as the source power of the internal RF/BB LDO. It is also used as 1.8 volts I/O power, external TCXO/LNA voltage source via built-in TCXO switch. The internal SMPS can switch to the LDO mode to supply power to each of the about block

The minimum/maximum input voltage of AVDD43_VBAT and AVDD43_DCV is 2.8/4.3 volts.

The power-on reset voltage threshold of AVDD43_VBAT is 2.7 ± 0.1 volts. The maximum TLDO drop out voltage at half load (25 mA) is 0.2 volts. If one external LDO is used to provide power to MT2503A, the 3.3 volts external LDO will be recommended after taking TLDO drop-out into consideration.

The power efficiency in SMPS mode will be better than that in the internal LDO mode.

I/O supports 1.8 and 2.8 volts. The power comes from SMPS output for 1.8 volts application or TLDO output (AVDD28_TLDO) for 2.8 volts application.

The power for internal flash comes from AVDD28_TLDO.

TCXO power is from AVDD_TCXO_SW that can select either from AVDD28_TLDO (2.8V) or from AVDD28_CLDO (1.8V) by setting up power-on strap.

RTC LDO input power comes from backup battery or uses coin battery.

Here are 3 power schemes: low power (Figure 54), low cost (Figure 55) and external PMU (Figure 56).

Figure 54. Power supply connection (low power)

Figure 55. Power supply connection (low cost)

Figure 56. Power supply connection (external LDO)

Figure 57. Power on/off sequence for external LDO mode

4.3 Electrical Characteristics

4.3.1 DC characteristics

4.3.1.1 Absolute maximum ratings

Symbol	Parameter	Rating	Unit
AVDD43_DCV	SMPS power supply	-0.3 ~ 4.3	V
AVDD43_VBAT	2.8 volts TLDO power supply	-0.3 ~ 4.3	V
AVDD28_CLDO	1.1 volts CLDO power supply	-0.3 ~ 3.6	V
DVDD28_SF	Embedded flash power supply	-0.3 ~ 3.6	V
DVDD28_IO1	IO 2.8/1.8 volts power supply	-0.3 ~ 3.6	V

DVDD28_I02			
DVDD11_CORE1 DVDD11_CORE2	Baseband 1.1 volts power supply	-0.3 ~ 1.21	V

V _{OL}	Output low voltage	VDDIO = min I _{OL} = -2 mA	-	-	0.15*VDDIO	V
V _{OH}	Output high voltage	VDDIO = min I _{OH} = -2 mA	0.85*VDDIO	-	-	V
R _{PU}	Input pull-up resistance	VDDIO = typ V _{input} = 0 V	40	85	190	KΩ
R _{PD}	Input pull-down resistance	VDDIO = typ V _{input} = 2.8 V	40	85	190	KΩ

4.3.1.5 DC electrical characteristics for 1.8 volts operation

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
VDD	Supply voltage of core power		0.99	1.1	1.21	V
VDDIO	Supply voltage of IO power		1.62	1.8	1.98	V
V _{IL}	Input lower voltage	LVTTTL	-0.3	-	0.25*VDDIO	V
V _{IH}	Input high voltage		0.75*VDDIO	-	VDDIO+0.3	V
V _{OL}	Output low voltage	VDDIO = min I _{OL} = -2 mA	-	-	0.15*VDDIO	V
V _{OH}	Output high voltage	VDDIO = min I _{OH} = -2 mA	0.85*VDDIO	-	-	V
R _{PU}	Input pull-up resistance	VDDIO = typ V _{input} = 0 V	70	150	320	KΩ
R _{PD}	Input pull-down resistance	VDDIO = typ V _{input} = 1.8 V	70	150	320	KΩ

4.3.1.6 DC electrical characteristics for 1.1 volts operation (for FORCE_ON and 32K_OUT)

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
--------	-----------	-----------	------	------	------	------

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
VDD	Supply voltage of core power		0.99	1.1	1.21	V
VDDIO	Supply voltage of IO power		0.99	1.1	1.21	V
V _{IL}	Input lower voltage	LVTTTL	-0.3	-	0.25*VDDIO	V
V _{IH}	Input high voltage		0.75*VDDIO	-	VDDIO+0.3	V
V _{OL}	Output low voltage	VDDIO = min I _{OL} = -2 mA	-	-	0.15*VDDIO	V
V _{OH}	Output high voltage	VDDIO = min I _{OH} = -2 mA	0.85*VDDIO	-	-	V
R _{PU}	Input pull-up resistance	VDDIO = typ V _{input} = 0 V	130		560	KΩ
R _{PD}	Input pull-down resistance	VDDIO = typ V _{input} = 1.1 V	130		560	KΩ

4.3.2 Analog related characteristics

4.3.2.1 SMPS DC characteristics

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
AVDD43_DCV	SMPS input supply voltage	2.8	3.3	4.3	V	
DCV	SMPS output	1.74	1.84	1.94	V	
I _{cc}	SMPS output current	-	-	100	mA	
ΔV _{PWM}	Ripple of PWM mode	-	-	40	mV	With L=1uH, C=4.7uF
ΔV _{PFM}	Ripple of PFM mode	-	-	90	mV	With L=1uH, C=4.7uF

4.3.2.2 TCXO LDO DC characteristics

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
AVDD43_VBAT	TCXO LDO input supply voltage	2.8	3.3	4.3	V	Will change to bypass mode under 3.1 volts
AVDD28_TLDO	TCXO LDO output	2.71	2.8	2.89	V	
I _{cc}	LDO output current	-	-	50	mA	Not include external devices
	PSRR-30 KHz	35	-	-	dB	Co = 1 uF, ESR = 0.05, Iload = 25 mA
	Load regulation	-84	10	84	mV	

4.3.2.3 TCXO SWITCH DC characteristics

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
--------	-----------	------	------	------	------	------

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
AVDD_TCXO_SW	TCXO switch output voltage @ TCXO switch input = AVDD28_TLDO	2.66	-	-	V	
AVDD_TCXO_SW	TCXO switch output voltage @ TCXO switch input = AVDD28_CLDO	1.71	-	-	V	
I _{max}	TCXO SWITCH current limit	-	-	30	mA	

4.3.2.4 1.1 volts core LDO DC characteristics

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
AVDD28_CLDO	1.2 volts LDO input supply voltage	1.62	1.8	3.08	V	
AVDD11_CLDO	1.1 volts LDO output	1.05	1.12	1.2	V	
I _{cc}	LDO output current	-	-	50	mA	
	Load regulation	-	-	-	mV	

4.3.2.5 1.1 volts RTC LDO DC characteristics

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
AVDD43_RTC	RTC LDO input supply voltage	2	4	4.3	V	
AVDD11_RTC	RTC LDO output	0.99	1.1	1.21	V	
I _{cc}	LDO output current	-	-	3	mA	
I _{leak}	Leakage current	2.2	10	-	uA	Including LDO and RTC domain circuit

4.3.2.6 32 KHz crystal oscillator (XOSC32)

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
AVDD11_RTC	Analog power supply	0.99	-	1.21	V	
Dcyc	Duty cycle	-	50	-	%	

4.3.3 RF related characteristics

4.3.3.1 DC electrical characteristics for RF part

Symbol	Parameter	Min.	Typ.	Max.	Unit
I _{cc} (GPS+GLONASS)	Total supply current:	-	8.9	-	mA

4.3.3.2 RX chain (GPS+GLONASS mode)

Parameter	Condition	Min.	Typ.	Max.	Unit
RF input frequency		-	1575.4	-	MHz
LO frequency		-	1588.6	--	MHz
LO leakage	Measured at balun matching network input at LNA high gain	-	-70	-	dBm
Input return loss	Differential input and external matched to 50Ω source using balun matching network for all gain	-10	-	-	dB
Gain (Av) (integrated average over Fc+-4M)	High current mode with max PGA gain	80	76	70	dB
	Low current mode with max PGA gain	-	64	-	dB
PGA Gain range		-	24	-	dB
PGA Gain step		-	2	-	dB
NF (integrated average over Fc+-4M)	High current mode with max PGA gain	-	2.2	-	dB

4.3.3.3 Crystal oscillator (XO)

Symbol	Parameter	Min.	Typ.	Max.	Unit
F _{tcxo}	TCXO oscillation frequency	12.6	16.368	40	MHz
V _{tcxo}	TCXO output swing	0.8	1.2	-	V _{pp}

4.4 Interface Characteristics

4.4.1 JTAG interface timing

Description	Sym bol	Min.	Max.	Unit	Note
TDI input setup to rising TCK	T1	0.35T	-	ns	1
TDI input hold from rising TCK	T2	0.15T	-	ns	1
TMS input setup to rising TCK	T1	0.35T	-	ns	1
TMS input hold from rising TCK	T2	0.15T	-	ns	1
Rising TCK to TDO valid	T3	-	0.5T	ns	1
TDO hold from rising TCK	T4	0	-	ns	1

Note: The maximal condition of JTAG clock cycle (TCK) is 50 MHz.

Figure 58. Timing diagram of JTAG interface

4.4.2 RS-232 interface timing

Baudrate required (bps)	Programmed baudrate (bps)	Baudrate error (%)	Baudrate error (%) ³
4,800	4,800.000	0.0000	0.002
9,600	9,600.000	0.0000	0.002
14,400	14,408.451	0.0587	0.0567
19,200	19,164.319	0.0587	0.0567
38,400	38,422.535	0.0587	0.0567
57,600	57,633.803	0.0587	0.0567
115,200	115,267.606	0.0587	0.0567
230,400	230,535.211	0.0587	0.0567
460,800	454,666.667	-1.3310	-1.3330
921,600	909,333.333	-1.3310	-1.3330

Notes:

1. UART baud-rate settings with UART_CLK frequency = 16.368 MHz (UART_CLK uses the reference clock of the system).
2. The baudrate error is optimized. Each baudrate needs to adjust counter to obtain the optimized error.

Figure 59. Timing diagram of RS-232 interface

4.4.3 SPI interface timing

Description	Symbol	Min.	Max.	Unit	Note
SCS# setup time	T1	0.5T	-	ns	1
SCS# hold time	T2	0.5T	-	ns	1
SO setup time	T3	0.5T - 3t	0.5T - 2t	ns	1, 2
SO hold time	T4	0.5T + 2t	0.5T + 3t	ns	1, 2
SIN setup time	T5	3t	-	ns	1, 2
SIN hold time	T6	10	-	ns	1

Notes:

- The condition of SPI clock cycle (T) is (SPI_IPLL/12) MHz ~ (rf_clk/1,020) MHz.
- t indicates the period of SPI controller clock, which is SPI_IPLL clock or rf_clk.

Figure 60. Timing diagram of SPI interface

4.4.4 I2C interface timing

Symbol	Period
T1	(MM_CNT_PHASE_VAL0+1)TCXO_CLK
T2	(MM_CNT_PHASE_VAL1+1)TCXO_CLK
T3	(MM_CNT_PHASE_VAL2+1)TCXO_CLK
T4	(MM_CNT_PHASE_VAL3+1)TCXO_CLK

Note: The condition of I2C clock cycle (I2C_CLK) is (TCXO_CLK/4) MHz ~ (TCXO_CLK/(MM_CNT+4)) MHz. The MM_CNT is sum of MM_CNT_PHASE_VAL0, MM_CNT_PHASE_VAL1, MM_CNT_PHASE_VAL2 and MM_CNT_PHASE_VAL3 in full speed mode.

Figure 61. Timing diagram of HOST I2C interface
