4.5 Out of Band Emissions: UNII-3 Unrestricted Band Edge

4.5.1 Limit(s)

CFR47 15.407 (b)(4)(i) and RSS 247 Sect.6.2.1.2: The maximum emissions outside of the frequency bands of operation shall be attenuated in accordance with the following limits:

(4) For transmitters operating in the 5.725-5.85 GHz band:

(i) All emissions shall be limited to a level of -27 dBm/MHz at 75 MHz or more above or below the band edge increasing linearly to 10 dBm/MHz at 25 MHz above or below the band edge, and from 25 MHz above or below the band edge increasing linearly to a level of 15.6 dBm/MHz at 5 MHz above or below the band edge, and from 5 MHz above or below the band edge increasing linearly to a level of 27 dBm/MHz at the band edge.

4.5.2 Test Method

Radiated measurements per ANSI C63.10-2013 Section 12.7.7.3 were used to measure the undesirable emission requirement in restricted bands. The measurement was performed with modulation. This test was conducted on the low channel for the low bandedge and the high channel for the high bandedge, in each applicable mode on the EUT. Preliminary tests were done to find the worse case modes (section 3.5.2 of this report). The power settings that were implemented are in section 4.1.4.1 of this report.

4.5.3 Test Setup

Spectrum Analyzer Settings:

	Peak Measurement
Detector	Peak
Trace	Max Hold
RBW	1 MHz
VBW	3 MHz
Sweep Points	501
Sweep Time	Coupled
Span	See Plots

CDD Mode

The DUT was stimulated by manufacturer provided test software that is not available to the end user.

Beamforming (BF) Mode

A conducted 4x4 MIMO client that supports beamforming was used to lock the beam. The client's antenna was routed in the chamber and put on the turntable outside the measuring antenna's beamwidth for the fundamental frequency. The EUT uses circular beamforming with a lockable beam as defined in ANSI C63.10-2013 Section 13. Network throughput software tool, iperf3, was used to stimulate the DUT's transmissions with a high duty cycle.

A customized software tool developed by the manufacturer was used to associate the DUT and the Client to any required data rates, channels and power settings before transmissions were initiated.

Iperf3 Command Line for DUT:

`iperf -c 192.168.16.1 -p 5021 -i 10 -t 4200 -w 320k -u -b 300M -P 4 -l 24000`

Iperf3 Command Line for Client (Support Equipment):

`iperf3 -s`

4.5.4 Results

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

4.6 Transmitter Spurious Emissions

Transmitter spurious emissions are emissions outside the frequency range of the equipment when the equipment is in transmit mode; per requirement of CFR47 15.205:2016, 15.209:2016, 15.407(b):2016, RSS 247 Sect. 6:2017, RSS GEN Sect.8.9 and 8.10:2014

4.6.1 Transmitter Spurious Emission Limit

The spurious emissions of the transmitter shall not exceed the values in CFR47 Part 15.205, 15.209, RSS 247 Sect. 6, RSS GEN Sect. 8.9 and 8.10

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490.....	2400/F (kHz)	300
0.490-1.705.....	24000/F (kHz)	30
1.705-30.0.....	30	30
30-88.....	100 **	3
88-216.....	150 **	3
216-960.....	200 **	3
Above 960.....	500	3

According to CFR47 15.407 (b) and RSS 247 Sect. 6.2.1.2, all harmonics and spurious emissions which are outside the 5150 MHz - 5250 MHz, 5250 MHz – 5350 MHz, or 5470 MHz – 5725 MHz shall not exceed -27 dBm/MHz. This is equivalent to 68.2 dBuV/m at 3 meter distance.

4.6.2 Test Methodology

4.6.2.1 Preliminary Test

A test program that controls instrumentation and data logging was used to automate the preliminary RF emission test procedure. The frequency range of interest was divided into sub-ranges to yield a frequency resolution of approximately 120 kHz and provide a reading at each frequency for no more than 12° of turntable rotation. For each frequency sub-range the turntable was rotated 360° while peak emission data was recorded and plotted over the frequency range of interest in horizontal and vertical antenna polarization's.

Preliminary emission profile testing was performed inside the anechoic chamber. The EUT was placed on a 1.0m x 1.5m non-conductive table 80cm (<1 GHz) and 150cm (>1 GHz) above the floor. The EUT was positioned as shown in the setup photographs. The receiving antenna was placed at a distance of 3m at a fixed height of 1m. Measurement equipment was located outside of the chamber. A video camera was placed inside the chamber to view the EUT.

Pres-scans were performed to determine the worst, data rate/ chains (section 3.5.2 of this report).

4.6.2.2 Final Test

For each frequency measured, the peak emission was maximized by manipulating the receiving antenna from 1 to 4 meters above the ground plane and placing it at the position that produced the maximum signal strength reading. The turntable was then rotated through 360° while observing the peak signal and placing the EUT at the position that produced maximum radiation. The six highest emissions relative to the limit were measured unless such emissions were more than 20 dB below the limit. If less than six emissions are within 20 dB of the limit, then the noise level of the receiver is measured at frequencies where emissions are expected. Multiples of all oscillator and microprocessor frequencies were also checked.

Final testing was performed on an NSA compliant test site. The EUT was placed on a 1.0m x 1.5m non-conductive table 80cm (<1 GHz) and 150cm (>1 GHz) above the ground plane. The placement of EUT and cables were the same as for preliminary testing and is shown in the setup photographs.

4.6.2.3 Deviations

None.

4.6.3 Test Setup:

4.6.3.1 CDD Mode

9KHz-1GHz

1-18GHz

18-40GHz

The DUT was stimulated by manufacturer provided test software that is not available to the end user.

4.6.3.2 Beamforming (BF) Mode

9KHz-1GHz

1-18GHz

18-40GHz

A conducted 4x4 MIMO client that supports beamforming was used to lock the beam. The client's antenna was routed in the chamber and put on the turntable outside the measuring antenna's beamwidth for the fundamental frequency. The EUT uses circular beamforming with a lockable beam as defined in ANSI C63.10-2013 Section 13. Network throughput software tool, iperf3, was used to stimulate the DUT's transmissions with a high duty cycle.

A customized software tool developed by the manufacturer was used to associate the DUT and the Client to any required data rates, channels and power settings before transmissions were initiated.

It was verified that there were no off times longer than 50% of the time spent on each sweep point during the pre-scans.

All modes were tested in 4x4 configuration

The same power settings and modulations that are used for 802.11n mode are used for Beamforming mode (802.11ac). Since beamforming is a spatially dependent phenomenon at the fundamental frequency, frequency ranges at the fundamental and higher were investigated.

Iperf3 Command Line for DUT:

`iperf -c 192.168.16.1 -p 5021 -i 10 -t 4200 -w 320k -u -b 300M -P 4 -l 24000`

Iperf3 Command Line for Client (Support Equipment):

`iperf3 -s`

4.6.4 Results

The final measurement data was taken under the worst case operating modes, configurations, and/or cable positions. It also reflects the results including any modifications and/or special accessories listed in Sections 1.4 and test plan.

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

4.6.5 Test Results

The final measurement data was taken under the worst case operating modes, configurations, and/or cable positions. It also reflects the results including any modifications and/or special accessories listed in Sections 1.4 and test plan.

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).
