A Test Lab Techno Corp. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by A Test Lab Techno Corp. based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

3 Test Methodology

3.1. Mode of Operation

ATL has verified the construction and function in typical operation. All the test modes were carried out with the EUT in normal operation, which was shown in this test report and defined as:

- GPRS 850 link mode
- GPRS 1900 link mode
- EGPRS 850 link mode
- EGPRS 1900 link mode
- WCDMA Band II link mode
- WCDMA Band V link mode

By preliminary testing and verifying three axis (X, Y and Z) position of EUT transmitted status, it was found that “X axis” position was the worst, then the final test was executed the worst condition and test data were recorded in this report.

Regards to the frequency band operation: the lowest, middle and highest frequency of channel were selected to perform the test, then shown on this report.

Software used to control the EUT for staying in continuous transmitting mode was programmed.

3.2. EUT Exercise Software

1	Setup the EUT and Base Station (CMU200) as shown on 3.3.
2	Turn on the power of all equipment.

4 Test Results

4.1. RF Output Power

■ Test Setup

■ Test Procedure

The EUT was set up for the maximum power with simulator.

Set the EUT to transmit under low, middle and high channel and record the power level shown on simulator.

The measurement is made according to FCC KDB 971168 D01 as below:

1. The transmitter output was connected to power meter and base station through Power Divider.
2. The EUT was set up for the max output power with pseudo random data modulation.
 - Set base station for EUT at GSM 850: PCL=5 and PCS 1900: PCL=0.
 - Set base station for EUT at WCDMA Band V and WCDMA Band II, power level was set to maximum.
3. Select lowest, middle, and highest channels for each band.
4. In all cases, output power is within the specified limits.

4.2. Effective Radiated Power / Equivalent Isotropic Radiated Power

■ Limit

For FCC Part 22.913(a)(2): The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts .

For FCC Part 24.232(c): The EIRP of mobile transmitters and auxiliary test transmitters must not exceed 2 Watts.

■ Test Setup

Below 1 GHz

Above 1 GHz

For Substituted Method Test Set-UP

■ Test Procedure

1. The EUT was set up for the maximum power. The power was measured with Spectrum Analyzer. All measurements were done at 3 channels (low, middle and high operational frequency range).
2. Radiation Emission measurement. In the semi-anechoic chamber, EUT placed on the 1.5m height of Turn Table, rotated the table around 360 degrees to search the maximum radiation power and receiver antenna shall be rotated vertical and horizontal polarization to find the maximum polar radiated power. The "Read Value" is the spectrum reading the maximum power value.
3. The substitution antenna is substituted for EUT at the same position and signals generator export the CW signal to the substitution antenna via a TX cable. Rotated the Turn Table and moved receiving antenna to find the maximum radiation power. Adjust output power level of S.G to get a Value of spectrum reading equal to "previously recorded (Pr)" of step a. Record the power level of S.G.

Below 1 GHz substituted method test used sleeve dipole antenna to Bi-Log antenna

Above 1 GHz substituted method test used horn antenna to horn antenna

E.I.R.P. = Output power level of S.G (P_{Mea}) + Amplifier Gain (P_{Ag}) - TX cable loss (P_{cl}) + Antenna gain of substitution horn (G_a)

E.R.P. = E.I.R.P- 2.15 dB

■ Test Result

Both of Vertical and Horizontal polarizations are evaluated, but only the worst case is recorded in this report.

$$\text{Peak EIRP (dBm)} = P_{\text{Mea}} - P_{\text{cl}} + P_{\text{Ag}} + G_{\text{a}}$$

$$\text{Peak ERP(dBm)} = P_{\text{Mea}} - P_{\text{cl}} + P_{\text{Ag}} + G_{\text{a}} - 2.15\text{dB}$$

4.3. Peak to Average Ratio

■ Limit

In measuring transmissions in this band using an average power technique, the peak to-average ratio (PAR) of the transmission may not exceed 13 dB.

■ Setup

■ Test Procedure

- Set resolution/measurement bandwidth signal's occupied bandwidth;
- Set the number of counts to a value that stabilizes the measured CCDF curve;
- Record the maximum PAPR level associated with a probability of 0.1%.

■ Test Result

4.4. Emission Bandwidth & Occupied Bandwidth

■ Setup

■ Test Procedure

The measurement is made according to FCC rules part 22 and 24:

1. The EUT was connected to Spectrum Analyzer and Base Station via Power Divider.
2. The occupied bandwidth of Low , middle and High channel for the highest RF powers was measured.

4.5. Frequency Stability

■ Limit

The frequency stability shall be measured by variation of ambient temperature and variation of primary supply voltage to ensure that the fundamental emission stays within the authorized frequency block. The frequency stability of the transmitter shall be maintained within $\pm 0.00025\%$ ($\pm 2.5\text{ppm}$) of the center frequency.

■ Setup

■ Test Procedure

The measurement is made according to FCC rules part 22 and 24:

1. The EUT and test equipment were set up as shown on the following section.
2. With all power removed, the temperature was decreased to -30°C and permitted to stabilize for three hours. Power was applied and the maximum change in frequency was note within one minute.
3. With power OFF, the temperature was raised in 10°C steps. The sample was permitted to stabilize at each step for at least one-half hour. Power was applied and the maximum frequency change was noted within one minute.
4. The EUT was placed in a temperature chamber at $25 \pm 5^{\circ}\text{C}$ and connected as the following section.
5. The power supply voltage to the EUT was varied from BEP to 115% of the nominal value measured at the input to the EUT.
6. The temperature tests were performed for the worst case.
7. Test data was recorded.

4.6. Band Edge

■ Limit

On any frequency outside frequency band of the US Cellular/PCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least $43+10\log(P)$ dB.

■ Setup

■ Test Procedure

The measurement is made according to FCC rules part 22 and 24:

1. The EUT was connected to Spectrum Analyzer and Base Station via Power Divider.
2. The band edge of low and high channels for the highest RF powers within the transmitting frequency band were measured. Setting RBW as roughly BW/100.
3. The band edge setting:
 For GSM 850 and PCS 1900, RB=5 kHz; VB=20 kHz.
 For WCDMA Band V and WCDMA Band II, RB=50 kHz; VB=200 kHz.

4.7. Radiated Spurious Emissions

■ Limit

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10\log(P)$ dB.

It is measured by means of a calibrated spectrum analyzer and scanned from 30 MHz up to a frequency including its 10th harmonic.

■ Setup

Below 1GHz

Below 1 GHz

Above 1GHz

For Substituted Method Test Set-UP

■ Test Procedure

1. The EUT was set up for the maximum power. The power was measured with Spectrum Analyzer. All measurements were done at 3 channels (low, middle and high operational frequency range).
2. Radiation Emission measurement. In the semi-anechoic chamber, EUT placed on the 1.5m height of Turn Table, rotated the table around 360 degrees to search the maximum radiation power and receiver antenna shall be rotated vertical and horizontal polarization to find the maximum polar radiated power. The "Read Value" is the spectrum reading the maximum power value.
3. The substitution antenna is substituted for EUT at the same position and signals generator export the CW signal to the substitution antenna via a TX cable. Rotated the Turn Table and moved receiving antenna to find the maximum radiation power. Adjust output power level of S.G to get a Value of spectrum reading equal to "previously recorded (Pr)" of step a. Record the power level of S.G.

Below 1 GHz substituted method test used sleeve dipole antenna to Bi-Log antenna

Above 1 GHz substituted method test used horn antenna to horn antenna

$E.I.R.P. = \text{Output power level of S.G (PMea)} - \text{TX cable loss (Pcl)} + \text{Antenna gain of substitution horn (Ga)}$

$E.R.P. = E.I.R.P. - 2.15 \text{ dB}$

4.8. Conducted Spurious Emission

■ Limit

Part 24.238 and Part 22.917 specify that the power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

■ Setup

Below 2.8GHz

Above 2.8GHz

■ **Test Procedure**

1. The EUT was connected to Spectrum Analyzer and Base Station via Power Divider.
2. The middle channel for the highest RF power within the transmitting frequency was measured.
3. The conducted spurious emission for the whole frequency range was taken.
