TEST DETAILS

Radio Testing of the
Piper Networks, Inc.
Piper Sensor SG1001

2.1 PEAK OUTPUT POWER

2.1.1 Specification Reference

Part 15 Subpart C §15.247(b)(3)

2.1.2 Standard Applicable

(3) For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

(4) The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

2.5.8 Test Results

Complies. See attached plots.

Bluetooth LE Low Channel (2402 MHz)

Lower Restricted Band Verification

Measured Peak = -56.65 dBm, since antenna gain is 12 dBi then EIRP is -44.65 dBm. Electric field strength in dBμV/m is then calculated using the formula:

$$E = \text{EIRP} - 20\log D + 104.8$$

Where: E = electric field strength in dBμV/m
EIRP = equivalent isotropic radiated power in dBm

D = specific measurement distance in meters

$$\begin{aligned} E \text{ is therefore} &= -44.65 \text{ dBm} - (20 \log 3 \text{ meters}) + 104.8 \\ &= 50.61 \text{ dB}\mu\text{V/m @ 3 meters} \end{aligned}$$

Since the peak field strength (50.61 dBμV/m) complies with the average limit (54 dBμV/m), then it's not necessary to perform a separate average measurement. **EUT complies 2.31-2.39 GHz restricted band.**

2.5.9 Emissions Verification in the Restricted Bands (Conducted Method)

Upper Band Edge (in Restricted Band)

Measured Peak = -39.29 dBm, since antenna gain is 12 dBi then EIRP is -27.29 dBm. Electric field strength in dBμV/m is then calculated using the formula:

$$E = \text{EIRP} - 20 \log D + 104.8$$

Where: E = electric field strength in dBμV/m
EIRP = equivalent isotropic radiated power in dBm
D = specific measurement distance in meters

$$\begin{aligned} E \text{ is therefore} &= -27.29 \text{ dBm} - (20 \log 3 \text{ meters}) + 104.8 \\ &= 67.97 \text{ dB}\mu\text{V/m @ 3 meters (complies with 74 dB}\mu\text{V/m Peak limits)} \end{aligned}$$

Upper Band Edge (in Restricted Band) measurement using Trace averaging with continuous EUT transmission at full power as per Clause 12.2.5.1 of KDB558074

$$\begin{aligned} E \text{ is therefore} &= (-60.39 + 12.0 \text{ dBi}) \text{ dBm} - (20 \log 3 \text{ meters}) + 104.8 \\ &= 46.87 \text{ dB}\mu\text{V/m @ 3 meters (complies with 54 dB}\mu\text{V/m Average limits)} \end{aligned}$$

2.6 SPURIOUS RADIATED EMISSIONS

2.6.1 Specification Reference

Part 15 Subpart C §15.247(d)

2.6.2 Standard Applicable

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Measurements above 10GHz were noise floor figures that was verified using lower RBW settings. Noise floor was more than 6 dB below the applicable limits.

2.7 POWER SPECTRAL DENSITY

2.7.1 Specification Reference

Part 15 Subpart C §15.247(e)

2.7.2 Standard Applicable

(e) For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.
