Competences and guarantees

AT4 wireless is a testing laboratory accredited by the National Accreditation Body (ENAC -Entidad Nacional de Acreditación), to perform the tests indicated in the Certificate No. 51/LE 147.

AT4 wireless is a laboratory with a measurement facility in compliance with the requirements of Section 2.948 of the FCC rules and has been added to the list of facilities whose measurements data will be accepted in conjunction with applications for Certification under Parts 15 or 18 of the Commission's Rules. Registration Number: 720267.

In order to assure the traceability to other national and international laboratories, AT4 wireless has a calibration and maintenance program for its measurement equipment.

AT4 wireless guarantees the reliability of the data presented in this report, which is the result of the measurements and the tests performed to the item under test on the date and under the conditions stated on the report and, it is based on the knowledge and technical facilities available at AT4 wireless at the time of performance of the test.

AT4 wireless is liable to the client for the maintenance of the confidentiality of all information related to the item under test and the results of the test.

The results presented in this Test Report apply only to the particular item under test established in this document.

IMPORTANT: No parts of this report may be reproduced or quoted out of context, in any form or by any means, except in full, without the previous written permission of AT4 wireless.

General conditions

1. This report is only referred to the item that has undergone the test.
2. This report does not constitute or imply on its own an approval of the product by the Certification Bodies or competent Authorities.
3. This document is only valid if complete; no partial reproduction can be made without previous written permission of AT4 wireless.
4. This test report cannot be used partially or in full for publicity and/or promotional purposes without previous written permission of AT4 wireless and the Accreditation Bodies.

Uncertainty

Uncertainty (factor $k=2$) was calculated according to the AT4 wireless internal document PODT000.

Usage of samples

Samples undergoing test have been selected by: **the client**

Sample S/01 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
48556C/079	GSEtrack with internal antenna	GSEtracker 1000	16164780	2016-11-03

Auxiliary elements used with the sample S/01:

Control N°	Description	Model	Serial N°	Date of reception
48556C/040	Battery	ER14505	---	2016-10-13

- Sample S/01 has undergone following test(s).
All radiated tests indicated in appendix A.

Sample S/02 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
48556C/080	GSEtrack with antenna connector	GSEtracker 1000	16164683	2016-11-03

Auxiliary elements used with the sample S/02:

Control N°	Description	Model	Serial N°	Date of reception
48556C/052	USB cable	---	---	2016-10-13
48556C/054	SMA cable	---	---	2016-10-13
48556C/063	USB cable	---	---	2016-10-13
48556C/066	AC/DC adapter	---	---	2016-10-13

- Sample S/02 has undergone following test(s).
All conducted tests indicated in appendix A.

Sample S/03 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
48556C/076	GSEtrack with internal antenna	GSEtracker 1000	16164777	2016-11-03

Auxiliary elements used with the sample S/03:

Control N°	Description	Model	Serial N°	Date of reception
48556C/044	Battery	ER14505	---	2016-10-13

- Sample S/03 has undergone following test(s).
All radiated tests indicated in appendix B.

Sample S/04 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
48556C/073	GSEtrack with antenna connector	GSEtracker 1000	16164698	2016-11-03

Auxiliary elements used with the sample S/04:

Control N°	Description	Model	Serial N°	Date of reception
48556C/052	USB cable	---	---	2016-10-13
48556C/054	SMA cable	---	---	2016-10-13
48556C/063	USB cable	---	---	2016-10-13
48556C/066	AC/DC adapter	---	---	2016-10-13

1. Sample S/04 has undergone following test(s).

All conducted tests indicated in appendix B.

Test sample description

The test sample consists of a tracking solution for insight and management of non-motorized Ground Support Equipment at airports.

Identification of the client

UNDAGRID BV

Hengelosestraat 500, Enschede, The Netherlands.

Testing period

The performed test started on 2016-10-18 and finished on 2017-01-26.

The tests have been performed at AT4 wireless.

Environmental conditions

In the control chamber, the following limits were not exceeded during the test:

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %
Shielding effectiveness	> 100 dB
Electric insulation	> 10 kΩ
Reference resistance to earth	< 1 Ω

In the semianechoic chamber, the following limits were not exceeded during the test.

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %
Air pressure	Min. = 860 mbar Max. = 1060 mbar
Shielding effectiveness	> 100 dB
Electric insulation	> 10 kΩ
Reference resistance to earth	< 1 Ω
Normal site attenuation (NSA)	< ±4 dB at 10 m distance between item under test and receiver antenna, (30 MHz to 1000 MHz)
Field homogeneity	More than 75% of illuminated surface is between 0 and 6 dB (26 MHz to 1000 MHz).

In the chamber for conducted measurements, the following limits were not exceeded during the test:

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %
Air pressure	Min. = 860 mbar Max. = 1060 mbar
Shielding effectiveness	> 100 dB
Electric insulation	> 10 kΩ
Reference resistance to earth	< 1 Ω

TEST CONDITIONS

Power supply (V):

$$V_{\text{nominal}} = 3.6 \text{ Vdc}$$

Type of power supply = DC voltage from battery

Type of antenna = Integral antenna

Declared Gain for antenna (maximum) = +3.1 dBi

TEST FREQUENCIES:

Lowest channel: 2402 MHz

Middle channel: 2440 MHz

Highest channel: 2480 MHz

The laptop computer was used to configure the EUT to continuously transmit at a specified output power in all channels.

BTLE	TX Power (dBm)
2402 MHz	1
2440 MHz	1
2480 MHz	1

CONDUCTED MEASUREMENTS

The equipment under test was set up in a shielded room and it is connected to the spectrum analyzer using a low loss RF cable. The reading of the spectrum analyzer is corrected with the cable loss.

The DC supply voltage is applied using an external calibrated power supply.

RADIATED MEASUREMENTS

All radiated tests were performed in a semi-anechoic chamber. The measurement antenna is situated at a distance of 3 m for the frequency range 30 MHz-1000 MHz (30 MHz-1000 MHz Bilog antenna) and at a distance of 1m for the frequency range 1 GHz-25 GHz (1 GHz-18 GHz Double ridge horn antenna and 18 GHz-40 GHz horn antenna).

For radiated emissions in the range 1 GHz-25 GHz that is performed at a distance closer than the specified distance, an inverse proportionality factor of 20 dB per decade is used to normalize the measured data for determining compliance.

The equipment under test was set up on a non-conductive platform above the ground plane and the situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

Radiated measurements setup $f < 1$ GHz

Radiated measurements setup $f > 1$ GHz

Occupied Bandwidth

RESULTS

(see next plots).

	Lowest frequency 2402 MHz	Middle frequency 2440 MHz	Highest frequency 2480 MHz
99% bandwidth (MHz)	1.037	1.041	1.076
-26 dBc bandwidth (MHz)	1.226	1.257	1.265
Measurement uncertainty (kHz)	<± 5.0		

Lowest Channel

Middle Channel

Highest channel

Section 15.247 Subclause (a) (2). 6 dB Bandwidth

SPECIFICATION

The minimum 6 dB bandwidth shall be at least 500 kHz.

RESULTS

6 dB Bandwidth (see next plots).

	Lowest frequency 2402 MHz	Middle frequency 2440 MHz	Highest frequency 2480 MHz
6 dB Spectrum bandwidth (kHz)	675.3	729.3	725.3
Measurement uncertainty (kHz)	<±11.0		

Verdict: PASS

6 dB BANDWIDTH.

Lowest Channel

Middle Channel

Highest Channel

Section 15.247 Subclause (b). Maximum output power and antenna gain

SPECIFICATION

For systems using digital modulation in the 2400-2483.5 MHz band: 1 watt (30 dBm).

RESULTS

The maximum peak conducted output power was measured using the method according to point 9.1.1. of Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 558074 D01 DTS Meas Guidance v03r05 dated 04/08/2016.

The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power.

MAXIMUM OUTPUT POWER. See next plots.

Maximum declared antenna gain: 3.1 dBi.

	Lowest frequency 2402 MHz	Middle frequency 2440 MHz	Highest frequency 2480 MHz
Maximum conducted power (dBm)	2.05	1.74	1.46
Maximum EIRP power (dBm)	5.15	4.84	4.56
Measurement uncertainty (dB)	<±0.78		

The maximum directional gain of the antenna is less than 6 dBi and therefore the maximum output power is not required to be reduced from the stated values.

Verdict: PASS

CONDUCTED PEAK POWER.

Lowest frequency

Middle frequency

Highest frequency

Section 15.247 Subclause (d). Emission limitations conducted (Transmitter)

SPECIFICATION

In any 100 kHz bandwidth outside the frequency band in which the digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, the attenuation required shall be 30 dB instead of 20 dB.

RESULTS:

Reference Level Measurement

	Lowest frequency 2402 MHz	Middle frequency 2440 MHz	Highest frequency 2480 MHz
Reference Level Measurement (dBm)	1.48	1.16	0.82
Measurement uncertainty (dB)	<±0.78		

Lowest frequency 2402 MHz:

All peaks are more than 20 dB below the limit.

Middle frequency 2440 MHz:

All peaks are more than 20 dB below the limit.

Highest frequency 2480 MHz:

All peaks are more than 20 dB below the limit.

Measurement uncertainty (dB): < 2.03

Verdict: PASS

Lowest frequency

Note: The peak shown in the plot above the limit is the carrier frequency.

Middle frequency

Note: The peak shown in the plot above the limit is the carrier frequency.

Highest frequency

Note: The peak shown in the plot above the limit is the carrier frequency.

Section 15.247 Subclause (d). Band-edge emissions compliance (Transmitter)

SPECIFICATION

In any 100 kHz bandwidth outside the frequency band in which the digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, the attenuation required shall be 30 dB instead of 20 dB.

RESULTS:

Note: Radiated measurements were used to show compliance with the limits in the restricted bands 2.31-2.39 GHz and 2.4835-2.5 GHz.

1. LOW FREQUENCY SECTION. CONDUCTED.

See next plot.

Verdict: PASS

2. HIGH FREQUENCY SECTION. CONDUCTED.

See next plot.

Measurement uncertainty (dB)

< ±2.03

Verdict: PASS

Section 15.247 Subclause (e). (2) Power spectral density

SPECIFICATION

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

RESULTS

The maximum power spectral density level in the fundamental emission was measured using the method PKPSD (Peak PSD) according to point 10.2. of Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 558074 D01 DTS Meas Guidance v03r05 dated 04/08/2016.

Power spectral density (see next plots).

	Lowest frequency 2402 MHz	Middle frequency 2440 MHz	Highest frequency 2480 MHz
Power spectral density (dBm)	1.49	1.16	0.82
Measurement uncertainty (dB)	<±0.78		

Verdict: PASS

POWER SPECTRAL DENSITY

Lowest Channel

Middle Channel

Highest Channel

Section 15.247 Subclause (d). Emission limitations radiated (Transmitter)

SPECIFICATION

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)):

Frequency Range (MHz)	Field strength ($\mu\text{V/m}$)	Field strength ($\text{dB}\mu\text{V/m}$)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
960 - 25000	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RESULTS:

The situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

All tests were performed in a semi-anechoic chamber at a distance of 3 m for the frequency range 30 MHz-1000 MHz and at distance of 1m for the frequency range 1 GHz-25 GHz.

The test was performed with the equipment transmitting first in only 2.4 GHz BT LE mode and repeated with the 915 MHz LoRa radio transmitting simultaneously to check the impact of the co-location of both radio interfaces. The results and plots below show the worst results obtained in both modes.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

Frequency range 30 MHz-1000 MHz.

The spurious signals detected do not depend on the operating channel.

All peaks are more than 20 dB below the limit.

Frequency range 1 GHz-25 GHz

The results in the next tables show the maximum measured levels in the 1-25 GHz range including the restricted bands 2.31-2.39 GHz and 2.4835-2.5 GHz (see next plots).

Spurious signals with peak levels above the average limit (54 dB μ V/m at 3 m) are measured with average detector for checking compliance with the average limit.

1. CHANNEL: LOWEST (2402 MHz).

Spurious frequency (GHz)	Polarization	Detector	Emission Level (dB μ V/m)	Measurement Uncertainty (dB)
2.38951	V	Peak	57.82	± 4.87
		Average	37.40	± 4.87
2.48537	V	Peak	49.76	± 4.87
4.80425	H	Peak	50.00	± 4.87
7.25675	V	Peak	54.82	± 4.87
		Average	53.37	± 4.87
9.60775	V	Peak	44.19	± 4.87

2. CHANNEL: MIDDLE (2440 MHz).

Spurious frequency (GHz)	Polarization	Detector	Emission Level (dB μ V/m)	Measurement Uncertainty (dB)
2.38904	V	Peak	49.12	± 4.87
4.87925	H	Peak	47.77	± 4.87
7.31925	V	Peak	43.20	± 4.87
9.76060	V	Peak	45.61	± 4.87

3. CHANNEL: HIGHEST (2480 MHz).

Spurious frequency (GHz)	Polarization	Detector	Emission Level (dB μ V/m)	Measurement Uncertainty (dB)
2.48650	V	Peak	73.21	± 4.87
		Average	43.88	± 4.87
4.96025	H	Peak	45.57	± 4.87

Verdict: PASS

FREQUENCY RANGE 30 MHz-1000 MHz.

(This plot is valid for all three channels).

FREQUENCY RANGE 1 GHz to 3 GHz.

CHANNEL: Lowest (2402 MHz).

Note: The peak shown in the plot above the limit is the carrier frequency.

CHANNEL: Middle (2440 MHz).

Note: The peak shown in the plot above the limit is the carrier frequency.

The e.i.r.p. shall not exceed 4 W (36 dBm) (Canada).

RESULTS

The maximum conducted (average) output power was measured using the method according to point 9.2.2.2. of Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 558074 D01 DTS Meas Guidance v03r05 dated 04/08/2016.

The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power.

MAXIMUM OUTPUT POWER. Conducted (average) output power. See next plots.

Maximum declared antenna gain: +5.7 dBi.

	Lowest frequency 903 MHz	Highest frequency 907.2 MHz
Maximum conducted power (dBm)	18.43	18.16
Maximum EIRP power (dBm)	24.13	23.86
Measurement uncertainty (dB)	<±0.78	

The maximum directional gain of the antenna is less than 6 dBi and therefore the maximum output power is not required to be reduced from the stated values.

Verdict: PASS

CONDUCTED POWER.

Lowest frequency

Highest frequency

Section 15.247 Subclause (d). Emission limitations conducted (Transmitter)

SPECIFICATION

In any 100 kHz bandwidth outside the frequency band in which the digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, the attenuation required shall be 30 dB instead of 20 dB.

RESULTS:

Reference Level Measurement

	Lowest frequency 903 MHz	Highest frequency 907.2 MHz
Reference Level Measurement (dBm)	18.97	18.90
Measurement uncertainty (dB)	<±0.78	

Lowest frequency 903 MHz:

All peaks are more than 20 dB below the limit.

Highest frequency 907.2 MHz:

All peaks are more than 20 dB below the limit.

Measurement uncertainty (dB): < 2.03

Verdict: PASS

Lowest frequency

Note: The peak shown in the plot above the limit is the carrier frequency.

Highest frequency

Note: The peak shown in the plot above the limit is the carrier frequency.

Section 15.247 Subclause (d). Band-edge emissions compliance (Transmitter)

SPECIFICATION

In any 100 kHz bandwidth outside the frequency band in which the digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, the attenuation required shall be 30 dB instead of 20 dB.

RESULTS:

1. LOW FREQUENCY SECTION. CONDUCTED.

See next plot.

Verdict: PASS

2. HIGH FREQUENCY SECTION. CONDUCTED.

See next plot.

Measurement uncertainty (dB)	< ±2.03
------------------------------	---------

Verdict: PASS

Section 15.247 Subclause (e). (2) Power spectral density

SPECIFICATION

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

RESULTS

The maximum power spectral density level in the fundamental emission was measured using the method AVGPSD-1 (AVG PSD) according to point 10.3. of Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 558074 D01 DTS Meas Guidance v03r05 dated 04/08/2016.

Power spectral density (see next plots).

	Lowest frequency 903 MHz	Highest frequency 907.2 MHz
Power spectral density (dBm)	-0.976	-0.755
Measurement uncertainty (dB)	<±0.78	

Verdict: PASS

POWER SPECTRAL DENSITY

Lowest Channel

Highest Channel

Section 15.247 Subclause (d). Emission limitations radiated (Transmitter)

SPECIFICATION

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)):

Frequency Range (MHz)	Field strength ($\mu\text{V/m}$)	Field strength ($\text{dB}\mu\text{V/m}$)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
960 - 25000	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RESULTS:

The situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

All tests were performed in a semi-anechoic chamber at a distance of 3 m for the frequency range 30 MHz-1000 MHz and at distance of 1m for the frequency range 1 GHz-10 GHz.

The test was performed with the equipment transmitting first in only 915 MHz LoRa mode and repeated with the 2.4 GHz BT LE radio transmitting simultaneously to check the impact of the co-location of both radio interfaces. The results and plots below show the worst results obtained in both modes.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

Frequency range 30 MHz-1000 MHz.

1. CHANNEL: LOWEST (903.0 MHz).

Spurious signals closest to limit:

Spurious frequency (MHz)	Polarization	Detector	Emission Level (dBμV/m)	Measurement Uncertainty (dB)
503.360	V	Quasi-Peak	27.38	± 3.88
526.543	V	Quasi-Peak	29.31	± 3.88
551.181	V	Quasi-Peak	30.49	± 3.88
598.614	V	Quasi-Peak	28.98	± 3.88
624.125	V	Quasi-Peak	35.06	± 3.88
624.901	V	Quasi-Peak	27.80	± 3.88

2. CHANNEL: HIGHEST (907.2 MHz).

Spurious signals closest to limit:

Spurious frequency (MHz)	Polarization	Detector	Emission Level (dBμV/m)	Measurement Uncertainty (dB)
480.080	V	Quasi-Peak	28.58	± 3.88
552.054	V	Quasi-Peak	30.33	± 3.88
576.595	V	Quasi-Peak	27.56	± 3.88
600.748	V	Quasi-Peak	30.28	± 3.88
623.537	V	Quasi-Peak	25.32	± 3.88
624.222	V	Quasi-Peak	35.89	± 3.88

Frequency range 1 GHz-10 GHz

The results in the next tables show the maximum measured levels in the 1-10 GHz range (see next plots).

Spurious signals with peak levels above the average limit (54 dBμV/m at 3 m) are measured with average detector for checking compliance with the average limit.

1. CHANNEL: LOWEST (903 MHz).

Spurious frequency (GHz)	Polarization	Detector	Emission Level (dBμV/m)	Measurement Uncertainty (dB)
1.80595 (*)	H	Peak	58.74	± 4.87
		Average	58.49	± 4.87
2.70955	H	Peak	51.66	± 4.87
3.61105	H	Peak	50.79	± 4.87
4.51465	H	Peak	38.55	± 4.87
5.41765	V	Peak	47.61	± 4.87
6.32215	H	Peak	41.77	± 4.87
7.22485	H	Peak	51.53	± 4.87
8.12695	H	Peak	44.52	± 4.87
9.02875	V	Peak	48.21	± 4.87
9.92335	H	Peak	48.06	± 4.87

(*): This spurious frequency is outside the restricted bands as defined in §15.205(a). The measured maximum carrier level at 3 m was 113.01 dBμV/m (Peak) so the spurious level is more than 30 dB below the carrier level.

2. CHANNEL: HIGHEST (907.2 MHz).

Spurious frequency (GHz)	Polarization	Detector	Emission Level (dBμV/m)	Measurement Uncertainty (dB)
1.81465 (*)	H	Peak	59.53	± 4.87
		Average	59.32	± 4.87
2.72185	H	Peak	51.83	± 4.87
3.62875	H	Peak	51.13	± 4.87
4.53625	H	Peak	38.86	± 4.87
5.44195	H	Peak	47.10	± 4.87
6.34885	H	Peak	41.83	± 4.87
7.25665	H	Peak	51.42	± 4.87
8.16385	H	Peak	46.52	± 4.87
9.06955	H	Peak	47.64	± 4.87

(*): This spurious frequency is outside the restricted bands as defined in §15.205(a). The measured maximum carrier level at 3 m was 112.22 dBμV/m (Peak) so the spurious level is more than 30 dB below the carrier level.

Verdict: PASS

FREQUENCY RANGE 30 MHz-1000 MHz.

CHANNEL: Lowest (903.0 MHz).

Note: The carrier was attenuated using a Notch filter.

CHANNEL: Highest (907.2 MHz).

Note: The carrier was attenuated using a Notch filter.

FREQUENCY RANGE 1 GHz to 10 GHz.

CHANNEL: Lowest (903.0 MHz).

CHANNEL: Highest (907.2 MHz).
