Laboratory Introduction

SIEMIC, headquartered in the heart of Silicon Valley, with superior facilities in US and Asia, is one of the leading independent testing and certification facilities providing customers with one-stop shop services for Compliance Testing and Global Certifications.

In addition to testing and certification, SIEMIC provides initial design reviews and compliance management throughout a project. Our extensive experience with China, Asia Pacific, North America, European, and International compliance requirements, assures the fastest, most cost effective way to attain regulatory compliance for the global markets.

2 Executive Summary

The purpose of this test program was to demonstrate compliance of following product

Company: Icarus Aviation Ltd
Product: Lifeline Mini
Model: MOB

against the current Stipulated Standards. The specified model product stated above has demonstrated compliance with the Stipulated Standard listed on 1st page.

10.2 Carrier Power

Requirement(s):

Spec	Requirement	Applicable									
RTCM SC11901 Annex A	Normal: With the output power set at maximum, the carrier power shall remain between 0.1 W and 0.5 W and be within ± 1.5 dB of the rated output power under normal test conditions. The output power shall never however drop below 0.1 W. Extreme: With the output power set at maximum, the carrier power shall remain between 0.1 W and 0.5 W and be within +2 dB, -3 dB of the rated output power under extreme conditions. The output power shall never however drop below 0.1 W.	☒									
RTCM SC11901 Annex E	The conducted power corrected for antenna gain shall be at least 27dBm	☒									
Test Setup											
Procedure	The transmitter shall be connected to an artificial antenna and the power delivered to this artificial antenna shall be measured. The measurements shall be made on channel 70, under normal test conditions (subclause 8.1.1.1) and under extreme test conditions (subclause 8.1.1.2).

10.3 Radiated Power

Requirement(s):

Spec	Requirement	Applicable									
RTCM SC11901 Annex E	The radiated power shall be at least 27dBm	☒									
Test Setup											
Procedure	a) The test antenna shall be raised and lowered through the specified range of heights until a maximum signal level is detected on the measuring receiver. b) The transmitter shall be rotated through 360° in the horizontal plane, until the maximum signal level is detected by the measuring receiver. c) The maximum signal level detected by the measuring receiver shall be noted. d) The transmitter shall be replaced by a calibrated antenna (substitution antenna) and calibrated RF source. e) The substitution antenna shall be orientated for vertical polarization and the length of the substitution antenna shall be adjusted to correspond to the frequency of the spurious component detected. f) The substitution antenna shall be connected to a calibrated signal generator. g) The frequency of the calibrated signal generator shall be set to the frequency of the spurious component detected. h) The input attenuator setting of the measuring receiver shall be adjusted in order to increase the sensitivity of the measuring receiver, if necessary. i) The test antenna shall be raised and lowered through the specified range of heights to ensure that the maximum signal is received. j) The input signal to the substitution antenna shall be adjusted to the level that produces a level detected by the measuring receiver that is equal to the level noted while the spurious component was measured, corrected for the change of input attenuator setting of the measuring receiver. k) The input level to the substitution antenna shall be recorded as power level, corrected for the change of input attenuator setting of the measuring receiver. l) The measurement shall be repeated with the test antenna and the substitution antenna orientated for horizontal polarization. m) The measure of the effective radiated power of the spurious components is larger of the two power levels recorded for spurious component at the input to the substitution antenna, corrected for the gain of the antenna if necessary;

10.4 Adjacent Channel Power

Requirement(s):

Spec	Requirement	Applicable									
RTCM SC11901 Annex A	The adjacent channel power shall not exceed a value of 70 dB below the carrier power of the transmitter without any need to be below 0.2 μ W.	☒									
Test Setup											
Procedure	The adjacent channel power can be measured with a power measuring receiver (referred to in this subclause as the "receiver") which conforms to ITU-R Recommendation SM 332-4: a) The transmitter shall be operated with the output power at maximum under normal test conditions. The output of the transmitter shall be linked to the input of the "receiver" by a connecting device such that the impedance presented to the transmitter is 50 ohms and the level at the "receiver" input is appropriate. b) With the transmitter unmodulated, the tuning of the "receiver" shall be adjusted so that a maximum response is obtained. This is the 0 dB response point. The "receiver" attenuator setting and the reading of the meter shall be recorded. c) The tuning of the "receiver" shall be adjusted away from the carrier so that the "receiver" -6 dB response nearest to the transmitter carrier frequency is located at a displacement from the nominal carrier frequency of 17 kHz. d) The transmitter shall be modulated with 1.25 kHz at a level which is 20 dB higher than that required to produce ± 3 kHz deviation. e) The "receiver" variable attenuator shall be adjusted to obtain the same meter reading as in step b) or a known relation to it. f) The ratio of adjacent channel power to carrier power is the difference between the attenuator settings in steps b) and e), corrected for any differences in the reading of the meter. g) The measurement shall be repeated with the "receiver" tuned to the other side of the carrier. The measurement may be made with the transmitter modulated with normal test modulation, in which case this fact shall be recorded with the test results.

10.5 Modulation spectrum slotted transmission

Requirement(s):

Spec	Requirement	Applicable
RTCM SC11901 Annex E		☒
Procedure	The transmitter shall be connected to an artificial antenna (see clause 6.4) with a means of measuring the power delivered to the load. The equipment shall be operated from the test power source (clause 6.7.2). Standard test signal number 3 (see clause 6.5.3) shall be used to modulate the transmitter in repeated packets. The measurement shall be made under normal test conditions. To determine the reference peak power and measure the emissions in the adjacent channels, the emission is suitably applied to the input of a spectrum analyser with the following preferred settings: • Resolution bandwidth: 1 kHz; • Video bandwidth: 3 kHz; • Scan bandwidth: 150 kHz; • Centre frequency: Carrier frequency AIS1 and AIS2; • Detector type: Peak hold. A sufficient number of sweeps shall be used and sufficient transmission packets measured to ensure that the emission profile is fully developed. A reference carrier power shall be calculated as being the maximum power within the frequency limits set in clause 8.1.3. The emission profile shall then be normalized so that the reference carrier power is set to 0 dBc. The result is compared to the mask given in figure 4.

Annex B. SIEMIC Accreditation

Accreditations	Document	Scope / Remark
ISO 17025 (A2LA)		Please see the documents for the detailed scope
ISO Guide 65 (A2LA)		Please see the documents for the detailed scope
TCB Designation		A1 , A2 , A3 , A4 , B1 , B2 , B3 , B4 , C
FCC DoC Accreditation		FCC Declaration of Conformity Accreditation
FCC Site Registration		3 meter site
FCC Site Registration		10 meter site
IC Site Registration		3 meter site
IC Site Registration		10 meter site
EU NB		Radio & Telecommunications Terminal Equipment: EN45001 – EN ISO/IEC 17025
		Electromagnetic Compatibility: EN45001 – EN ISO/IEC 17025
Singapore iDA CB(Certification Body)	 	Phase I , Phase II
Vietnam MIC CAB Accreditation		Please see the document for the detailed scope
Hong Kong OFCA		(Phase II) OFCA Foreign Certification Body for Radio and Telecom
		(Phase I) Conformity Assessment Body for Radio and Telecom
Industry Canada CAB		Radio: Scope A – All Radio Standard Specification in Category I
		Telecom: CS-03 Part I, II, V, VI, VII, VIII

Japan Recognized Certification Body Designation		Radio: A1. Terminal equipment for purpose of calling Telecom: B1. Specified radio equipment specified in Article 38-2, Paragraph 1, Item 1 of the Radio Law
