1. ATTESTATION OF TEST RESULTS

COMPANY NAME: HARRIS CORP.
2400 PALM BAY RD NE.
PALM BAY, FL, 32905 USA

EUT DESCRIPTION: AIRBORNE STATION

MODEL: ABR, P/N 1521K0012

SERIAL NUMBER: T0002845

DATE TESTED: 2016-02-02 – 2016-06-02

APPLICABLE STANDARDS	
STANDARD	TEST RESULTS
CFR 47 Part 15 Subpart C	Pass

UL LLC tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL LLC based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

Note: The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL LLC and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL LLC will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, any agency of the Federal Government, or any agency of any government.

Approved & Released For
UL Verification Services Inc. By:

JEFF MOSER
EMC PROGRAM MANAGER
UL Verification Services Inc.

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with FCC CFR 47 Part 2, FCC CFR 47 Part 15, ANSI C63.10-2013, KDB 558074 D01 v03r05.

3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 12 Laboratory Dr., Research Triangle Park, NC 27709, USA and 2800 Suite B Perimeter Park Dr., Morrisville, NC 27560.

12 Laboratory Dr., RTP, NC 27709	
☐	Chamber A
☐	Chamber C

2800 Suite B Perimeter Park Dr., Morrisville, NC 27560	
☐	Chamber NORTH
☒	Chamber SOUTH

UL LLC (RTP) is accredited by NVLAP, Laboratory Code 200246-0. The full scope of accreditation can be viewed at <http://www.nist.gov/nvlap/>.

4. CALIBRATION AND UNCERTAINTY

4.1. MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

4.2. SAMPLE CALCULATION

Where relevant, the following sample calculation is provided:

$$\begin{aligned}\text{Field Strength (dBuV/m)} &= \text{Measured Voltage (dBuV)} + \text{Antenna Factor (dB/m)} + \\ &\text{Cable Loss (dB)} - \text{Preamp Gain (dB)} \\ 36.5 \text{ dBuV} + 18.7 \text{ dB/m} + 0.6 \text{ dB} - 26.9 \text{ dB} &= 28.9 \text{ dBuV/m}\end{aligned}$$

4.3. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus.

PARAMETER		UNCERTAINTY
Total RF power, conducted	+/-	0.45
RF power density, conducted	+/-	1.50
Spurious emissions, conducted	+/-	2.94
All emissions, radiated up to 18 GHz	+/-	5.36
Temperature	+/-	0.07
Humidity	+/-	2.26
DC and low frequency voltages	+/-	1.27
Conducted Disturbance, 0.15 to 30 MHz	+/-	2.37

Uncertainty figures are valid to a confidence level of 95%.

5. EQUIPMENT UNDER TEST

5.1. DESCRIPTION OF EUT

The EUT is a airborne 2.4 GHz transceiver intended to communicate with ground stations.

5.2. MAXIMUM OUTPUT POWER

The transmitter has a maximum conducted output power as follows:

Frequency Range (MHz)	Mode	Output Power (dBm)	Output Power (mW)
Patch Antenna			
2408.57-2437.03	540 kHz	29.40	870.96
2410.30-2435.30	4.5 MHz	30.00	1000.00
2412.80-2432.80	9 MHz	28.80	758.58
Yagi			
2408.57-2437.03	540 kHz	26.50	446.68
2410.30-2435.30	4.5 MHz	26.90	489.78
2412.80-2432.80	9 MHz	26.30	426.58

5.3. DESCRIPTION OF AVAILABLE ANTENNAS

At installation, the radio is connected to two antennas. The Full Duplex Quad (FDQ) antenna is a transmit and receive antenna containing two Yagi antennas and two patch antennas within the radome. Switches and other components in the antenna permit the radio to connect to any one of the four antennas. The FDQ is approximately ten inches tall and is mounted on the underside of the aircraft. The second antenna connected to the radio is a High Performance Blade (HPB) antenna. The HPB is a receive-only antenna thirty inches long and three inches wide, mounted on the underside of the aircraft. The HPB contains multiple columns of patch antennas to form receive beams broadside to the aircraft. The HPB contains low-noise amplifiers and switches. The HPB and FDQ antennas were included in the FCC test setup.

The FDQ Patch antennas, have a maximum gain of 4.25 dBi and the FDQ Yagi antennas have a maximum gain of 6.08 dBi.

5.4. SOFTWARE AND FIRMWARE

The software/firmware is as follows:

Version: 0.0.3
Revision: 6002
Build ID: 203
Package ID: 2.

5.5. WORST-CASE CONFIGURATION AND MODE

Radiated emission tests from 1 GHz to 18 GHz was tested at L/M/H channels. Conducted emissions was not performed since the ABR is intended for installation on an aircraft. Below 1GHz and above 18GHz was tested at highest power for the lowest and highest available BW.

The fundamental of the EUT was investigated in three orthogonal orientations: 1, 2, and 3. It was determined that orientation 1 was worst-case orientation for the Yagi antenna and orientation 2 was worst-case orientation for the Patch antenna; therefore, all final radiated testing was performed with the EUT in those respective orientations. Please refer to the setup photos for more details.

The manufacturer configured the system to provide the maximum throughput based on the highest output power. The manufacturer deemed that QPSK modulation yields highest power and yields worst-case results. Therefore, QPSK modulation was used for all testing.

Radiated emissions for EUT with antenna was performed and passed; therefore, antenna port spurious was not performed.

5.6. DESCRIPTION OF TEST SETUP

SUPPORT EQUIPMENT

Support Equipment List				
Description	Manufacturer	Model	Serial Number	FCC ID
Power Supply (28V)	Astron	28VDC	N/A	N/A
Duplexer	Harris	N/A	N/A	N/A
RRH	Harris	RRH-1	T0002748	2AJN8-GS1
BBU	Harris	BBU-1	T0002780	N/A
RRH POWER SUPPLY	Newmar	D/C 1639	N/A	N/A

I/O CABLES

I/O Cable List						
Cable No	Port	# of identical ports	Connector Type	Cable Type	Cable Length (m)	Remarks
1	DC	1	-	-	3.05	
2	GPS	1	Coax	Coax	15.25	
3	Tx Antenna Port	1	SMA	Coax	1.5	
4	Rx Antenna Port	4	SMA	Coax	1.5	
5	LAN	1	RJ45	CAT5e	10.5	

TEST SETUP

Antenna Port Conducted Test Setup

The ABR was connected to a Linux PC to enable commanding of the system to perform FCC testing. The Ground system (BBU Chassis (BBU & SCM), RRH and EPC emulator) was directly connected to the ABR to enable FCC testing. A 28 VDC power supply was connected to the ABR to emulate aircraft power. A GPS antenna was connected to the ABR to emulate aircraft supplied GPS signals. The ABR Transmit output (J9) was connected to the Spectrum Analyzer and all FCC measurements were made at this port.

Radiated Test Setup

The ABR was connected to a Linux PC to enable commanding of the system to perform FCC testing. The Ground system (BBU Chassis (BBU & SCM), RRH and EPC emulator) was directly connected to the ABR to enable FCC testing. A 28 VDC power supply was connected to the ABR to emulate aircraft power. A GPS antenna was connected to the ABR to emulate aircraft supplied GPS signals. The ABR, FDQ and HPB antennas were located in the EMI chamber and the Ground station components were located outside of the EMI chamber. The ABR Transmit output (J9) was connected to the FDQ antenna and the ABR Receive ports (J4, J5 and J7) were connected to the HPB antenna. UL Verification Labs utilized various test antennas to measure the radiated emissions of the ABR system.

Power Settings

Conducted Testing Note – The manufacturer states that the maximum cable loss from the antenna port to the antenna is 3 dB. Therefore, the EUT was set at the highest allowed power setting to overcome the antenna cable 3 dB loss during testing. This power setting was determined by the output power measurements made at the end of the antenna cable and was used throughout testing.

All tests were performed at the maximum allowed power setting (setting for 4.25 dBi Patch antenna) determined during power measurements, except Output Power which was performed at two different settings (4.25 dBi Patch and 6.06 dBi Yagi antenna setting). With the exception of Power and PSD, all testing was performed at the antenna port connector at the maximum allowed power setting which would be considered worst-case. Power and PSD were performed at the maximum power setting that was determined during Output Power measurements and measured at the end of the antenna cable (3dB cable loss).

SETUP DIAGRAM FOR TESTS

6. TEST AND MEASUREMENT EQUIPMENT

The following test and measurement equipment was utilized for the tests documented in this report:

Test Equipment Used - Wireless Conducted Measurement Equipment

Equipment ID	Description	Manufacturer	Model Number	Last Cal.	Next Cal.
Conducted Room 1					
SA0019	Spectrum Analyzer	Agilent Technologies	E4446A	2015-09-02	2016-09-30

Note - All final radiated testing was performed between 2016-05-15 and 2016-06-15.

7. MEASUREMENT METHODS

Duty Cycle: KDB 558074 D01 v03r05 Section 6.0

6 dB BW: KDB 558074 D01 v03r05, Section 8.1.

Output Power: KDB 558074 D01 v03r05, Section 9.2.3.1.

Power Spectral Density: KDB 558074 D01 v03r05, Section 10.2.

Power Spectral Density: KDB 558074 D01 v03r05, Section 10.3 & 10.5.

Out-of-band emissions in non-restricted bands: KDB 558074 D01 v03r05, Section 11.0.

Out-of-band emissions in restricted bands: KDB 558074 D01 v03r05, Section 12.1.

Out-of-band emissions in restricted bands: KDB 558074 D01 v03r05, Section 12.2.

General Radiated Emissions – ANSI C63.10 Sections 6.3-6.6

Line Conducted Emissions – ANSI C63.10 Section 6.2

8. ANTENNA PORT TEST RESULTS – AUTHORIZED BAND

8.1. ON TIME AND DUTY CYCLE

LIMITS

None; for reporting purposes only.

PROCEDURE

KDB 558074 Zero-Span Spectrum Analyzer Method.

ON TIME AND DUTY CYCLE RESULTS

Mode	ON Time B (msec)	Period (msec)	Duty Cycle x (linear)	Duty Cycle (%)	Duty Cycle Correction Factor (dB)	1/B Minimum VBW (kHz)
2.4GHz Band						
540 kHz	4.107	4.107	1.000	100.00%	0.00	0.010
9MHz	4.107	4.107	1.000	100.00%	0.00	0.010

DUTY CYCLE PLOTS

2.4 GHz BAND

8.2. 540 kHz CHANNEL BANDWIDTH IN THE 2.4 GHz BAND

8.2.1. 6 dB BANDWIDTH

LIMITS

FCC §15.247 (a) (2)

The minimum 6 dB bandwidth shall be at least 500 kHz.

RESULTS

Channel	Frequency (MHz)	6 dB Bandwidth (MHz)	Minimum Limit (MHz)
Low	2408.57	0.590	0.5
Mid	2418.57	0.570	0.5
High	2437.03	0.577	0.5

6 dB BANDWIDTH

NOTE: This test was performed at the maximum allowed power settings determined during Output Power measurements (4.25 dBi antenna setting). It was also performed at the antenna output of the EUT which is worst-case.

8.2.2. OUTPUT POWER

LIMITS

FCC §15.247 (b) (3)

For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt, based on the use of antennas with directional gains that do not exceed 6 dBi. If transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

DIRECTIONAL ANTENNA GAIN

There is only one transmitter output therefore the directional gain is equal to the antenna gain.

RESULTS

NOTE: This test was performed at both antenna power settings (4.25 dBi Patch antenna and 6.08 dBi Yagi antenna). The power for this test was measured at the end of the antenna cable to incorporate worst-case cable loss (3 dB). The EUT's power setting was set to highest allowable level to overcome the 3 dB cable loss. The maximum setting was dictated by these power measurements.

Limits

Channel	Frequency (MHz)	Directional Gain (dBi)	FCC Power Limit (dBm)	IC Power Limit (dBm)	IC EIRP Limit (dBm)	Max Power (dBm)

8.2.3. POWER SPECTRAL DENSITY

LIMITS

FCC §15.247 (e)

RESULTS

NOTE: This test was performed at the maximum allowed power settings (4.25 dBi Patch antenna). The power spectral density for this test was measured at the end of the antenna cable to incorporate worst-case cable loss (3 dB). The EUT's power setting was set to maximum allowed by the power measurements to overcome the 3 dB cable loss.

PSD, Chain 1

8.2.4. OUT-OF-BAND EMISSIONS

LIMITS

FCC §15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required.

RESULTS

NOTE: This test was performed at the maximum allowed power settings determined during Output Power measurements (4.25 dBi Patch antenna setting). It was also performed at the antenna output of the EUT which is worst-case.

8.4. 9 MHz MODE IN THE 2.4 GHz BAND

8.4.1. 6 dB BANDWIDTH

LIMITS

FCC §15.247 (a) (2)

The minimum 6 dB bandwidth shall be at least 500 kHz.

RESULTS

Channel	Frequency (MHz)	6 dB Bandwidth (MHz)	Minimum Limit (MHz)
Low	2412.8	8.974	0.5
Mid	2422.8	8.988	0.5
High	2432.8	8.918	0.5

6 dB BANDWIDTH

NOTE: This test was performed at the antenna output of the EUT which is worst-case.

8.4.2. OUTPUT POWER

LIMITS

FCC §15.247 (b) (3)

For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt, based on the use of antennas with directional gains that do not exceed 6 dBi. If transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

DIRECTIONAL ANTENNA GAIN

There is only one transmitter output therefore the directional gain is equal to the antenna gain.

RESULTS

NOTE: This test was performed at both antenna power settings (4.25 dBi Patch antenna and 6.08 dBi Yagi antenna). The power for this test was measured at the end of the antenna cable to incorporate worst-case cable loss (3 dB). The EUT's power setting was set to highest allowable level to overcome the 3 dB cable loss. The maximum setting was dictated by these power measurements.

Limits

8.4.3. POWER SPECTRAL DENSITY

LIMITS

FCC §15.247 (e)

RESULTS

NOTE: This test was performed at the maximum allowed power settings (4.25 dBi Patch antenna). The power spectral density for this test was measured at the end of the antenna cable to incorporate worst-case cable loss (3 dB). The EUT's power setting was set to maximum allowed by the power measurements to overcome the 3 dB cable loss.

PSD, Chain 1

8.4.4. OUT-OF-BAND EMISSIONS

LIMITS

FCC §15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required.

RESULTS

NOTE: This test was performed at the maximum allowed power settings determined during Output Power measurements (4.25 dBi Patch antenna setting). It was also performed at the antenna output of the EUT which is worst-case.

OUT-OF-BAND EMISSIONS

9. RADIATED TEST RESULTS

9.1. LIMITS AND PROCEDURE

LIMITS

FCC §15.205, 15.209, 15.247 (d)

Frequency Range (MHz)	Field Strength Limit (uV/m) at 3 m	Field Strength Limit (dBuV/m) at 3 m
30 - 88	100	40
88 - 216	150	43.5
216 - 960	200	46
Above 960	500	54

TEST PROCEDURE

The EUT is placed on a non-conducting table 80 cm above the ground plane for below 1GHz measurements and 1.5 m above the ground plane for above 1GHz measurements. The antenna to EUT distance is 3 meters.

For measurements below 1 GHz the resolution bandwidth is set to 120 kHz for peak detection measurements or 120 kHz for quasi-peak detection measurements for the 30-1000 MHz range, 9 kHz for peak detection measurements or 9 kHz for quasi-peak detection measurements for the 0.15-30 MHz range and 200 Hz for peak detection measurements or 200 Hz for quasi-peak detection measurements for the 9 to 150 kHz range. Peak detection is used unless otherwise noted as quasi-peak.

For peak measurements above 1 GHz, the resolution bandwidth is set to 1 MHz and the video bandwidth is set to 3 MHz. For average measurements above 1GHz, the resolution bandwidth and video bandwidth are set as described in ANSI C63.10:2013 for the applicable measurement. For this evaluation, RMS Power Averaging was used and the resolution/video bandwidth settings were 1MHz/3MHz.

The spectrum from 30MHz to 26 GHz is investigated with the transmitter set to the lowest, middle, and highest channels in each applicable band.

The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and the horizontal positions.

* - indicates frequency in CFR47 Pt 15 / IC RSS-Restricted Band

Pk - Peak detector

10. AC POWER LINE CONDUCTED EMISSIONS

LIMITS

FCC §15.207 (a)

Frequency of Emission (MHz)	Conducted Limit (dBuV)	
	Quasi-peak	Average
0.15-0.5	66 to 56 [*]	56 to 46 [*]
0.5-5	56	46
5-30	60	50

^{*} Decreases with the logarithm of the frequency.

TEST PROCEDURE

The EUT is placed on a non-conducting table 40 cm from the vertical ground plane and 80 cm above the horizontal ground plane. The EUT is configured in accordance with ANSI C63.4.

The receiver is set to a resolution bandwidth of 9 kHz. Peak detection is used unless otherwise noted as quasi-peak or average.

Line conducted data is recorded for both NEUTRAL and HOT lines.

RESULTS

This testing was deemed not applicable because the EUT is supplied via an aircraft's APU (auxiliary power unit) and not via direct or indirect connection to the public utility (AC) power line.
