Original model No. in report SZEM170100059702: A4

Only the model A4 was tested in report SZEM170100059702.

New model No. in report SZEM170100059802: IA1209

This report was an additional report copied from the report SZEM170100059702, just changed the information of applicant, product name, model No. and trade mark, added the new pictures. Since the electrical circuit design, layout, components used and internal wiring for the model in the report SZEM170100059702 was exactly the same as the model in this report, only the different on model name. Therefore original data were kept in this report SZEM170100059802.

5 SAR Evaluation

5.1 RF Exposure Compliance Requirement

5.1.1 Standard Requirement

According to KDB447498D01 General RF Exposure Guidance v06

4.3.1. Standalone SAR test exclusion considerations

Unless specifically required by the published RF exposure KDB procedures, standalone 1-g head or body and 10-g extremity SAR evaluation for general population exposure conditions, by measurement or numerical simulation, is not required when the corresponding SAR Exclusion Threshold condition, listed below, is satisfied.

5.1.2 Limits

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

$$\left[\frac{(\text{max. power of channel, including tune-up tolerance, mW})}{(\text{min. test separation distance, mm})} \cdot \sqrt{f(\text{GHz})} \right] \leq 3.0 \text{ for 1-g SAR and } \leq 7.5 \text{ for 10-g extremity SAR, where}$$

$f(\text{GHz})$ is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation¹⁷

The result is rounded to one decimal place for comparison

The test exclusions are applicable only when the minimum test separation distance is ≤ 50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion

5.1.3 EUT RF Exposure

The Max Conducted Peak Output Power is 9.78dBm in lowest channel(2.412GHz);
9.78dBm logarithmic terms convert to numeric result is nearly 9.51mW.

According to the formula. calculate the test exclusion thresholds:

$$\left[\frac{(\text{max. power of channel, including tune-up tolerance, mW})}{(\text{min. test separation distance, mm})} \cdot \sqrt{f(\text{GHz})} \right]$$

General RF Exposure = $(9.51\text{mW} / 5 \text{ mm}) \times \sqrt{2.412\text{GHz}} = 2.95$ ①

SAR requirement:

S= 3.0

② ;

① < ②.

So the SAR report is not required.
